YLL	years of life lost

# Introduction

The World Health Statistics series is WHO's annual compilation of health-related data for its 193 Member States, and includes a summary of the progress made towards achieving the health-related Millennium Development Goals (MDGs) and associated targets.

As with previous versions, *World Health Statistics 2010* has been compiled using publications and databases produced and maintained by the technical programmes and regional offices of WHO. Indicators have been included on the basis of their relevance to global public health; the availability and quality of the data; and the reliability and comparability of the resulting estimates.

Taken together, these indicators provide a comprehensive summary of the current status of national health and health systems in the following nine areas:

- mortality and burden of disease;
- cause-specific mortality and morbidity;
- selected infectious diseases;
- health service coverage;
- risk factors;
- health workforce, infrastructure and essential medicines;
- health expenditure;
- health inequities; and
- demographic and socioeconomic statistics.

The estimates in this book are derived from multiple sources, depending on each indicator and the availability and quality of data. In many countries, statistical and health information systems are weak and the underlying empirical data may not be available or may be of limited quality. Every effort has been made to ensure the best use of country-reported data – adjusted where necessary to deal with missing values, to correct for known biases, and to maximize the comparability of the statistics across countries and over time. In addition, statistical techniques and modelling have been used to fill data gaps.

Because of the weakness of the underlying empirical data in many countries, a number of the indicators are associated with significant uncertainty. It is WHO policy on statistical transparency to make available to users the methods of estimation and the margins of uncertainty for relevant indicators. However, because of space restrictions, printed versions of the World Health Statistics series include uncertainty ranges for only a few indicators. Further information on the margins of uncertainty for additional indicators will be made available at the Global Health Observatory web site.<sup>1</sup>

<sup>1</sup> The Global Health Observatory is a WHO portal that provides access to data and analyses for monitoring the global health situation and trends. [www.who.int/gho](http://www.who.int/gho)

While every effort has been made to maximize the comparability of the statistics across countries and over time, users are advised that country data may differ in terms of the definitions used, data-collection methods, population coverage and estimation methods. More-detailed information on indicator metadata is available in the Indicator and Metadata Registry.<sup>2</sup>

WHO presents *World Health Statistics 2010* as an integral part of its ongoing efforts to provide enhanced access to high-quality data on core measures of population health and national health systems. Unless otherwise stated, all estimates have been cleared following consultation with Member States and are published here as official WHO figures. However, these best estimates have been derived using standard categories and methods to enhance their cross-national comparability. As a result they should not be regarded as the nationally endorsed statistics of Member States which may have been derived using alternative methodologies.

# Part I

## Health-related Millennium Development Goals

## Summary of status and trends

With only five years remaining to 2015, there are signs of progress in many countries in achieving the health-related Millennium Development Goals (MDGs). In other countries, progress has been limited because of conflict, poor governance, economic or humanitarian crises, and lack of resources. The effects of the global food, energy, financial and economic crises on health are still unfolding, and action is needed to protect the health spending of governments and donors alike.

**Undernutrition** is an underlying cause in about one third of all child deaths. Over the past year, rising food prices coupled with falling incomes have increased the risk of malnutrition, especially among children. Although the percentage of children under 5 years of age who are underweight (compared to the WHO Child Growth Standards<sup>3</sup>) declined globally from 25% in 1990 to 18% in 2005, subsequent progress has been uneven. In some countries, the prevalence of undernutrition has increased, and worldwide stunted growth still affected about 186 million children under 5 years of age in 2005.

Globally, **child mortality** continues to fall. In 2008, the total annual number of deaths in children under 5 years old fell to 8.8 million – down by 30% from the 12.4 million estimated in 1990. Mortality in children under 5 years old in 2008 was estimated at 65 per 1000 live births, which is a 27% reduction from 90 per 1000 live births in 1990 (Figure 1). Recent encouraging trends also indicate an acceleration of the rate of decline in all regions since 2000 (Table 1).

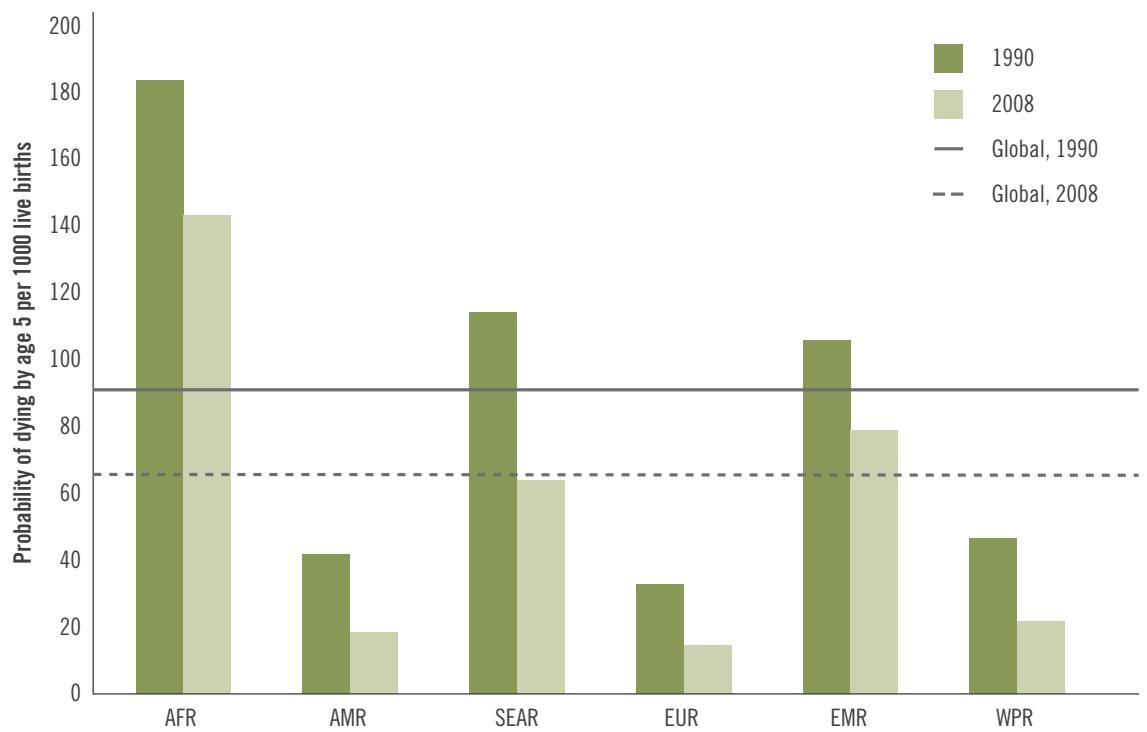

**Table 1: Average annual rate of decline (%) in mortality in children under 5 years old – 1990–1999 and 2000–2008**

WHO region	1990–1999	2000–2008
African Region	0.9	1.8
Region of the Americas	4.2	4.6
South-East Asia Region	2.5	3.8
European Region	3.6	5.6
Eastern Mediterranean Region	1.5	1.7
Western Pacific Region	2.5	5.7
<b>GLOBAL</b>	<b>1.2</b>	<b>2.3</b>

<sup>3</sup> WHO Child Growth Standards. Length/height-for-age, weight-for-age, weight-for-length, weight-for-height and body mass index-for-age: Methods and development. WHO Multicentre Growth Reference Study Group. Geneva, World Health Organization, 2006, page 312.  
[www.who.int/childgrowth/publications/en/](http://www.who.int/childgrowth/publications/en/)

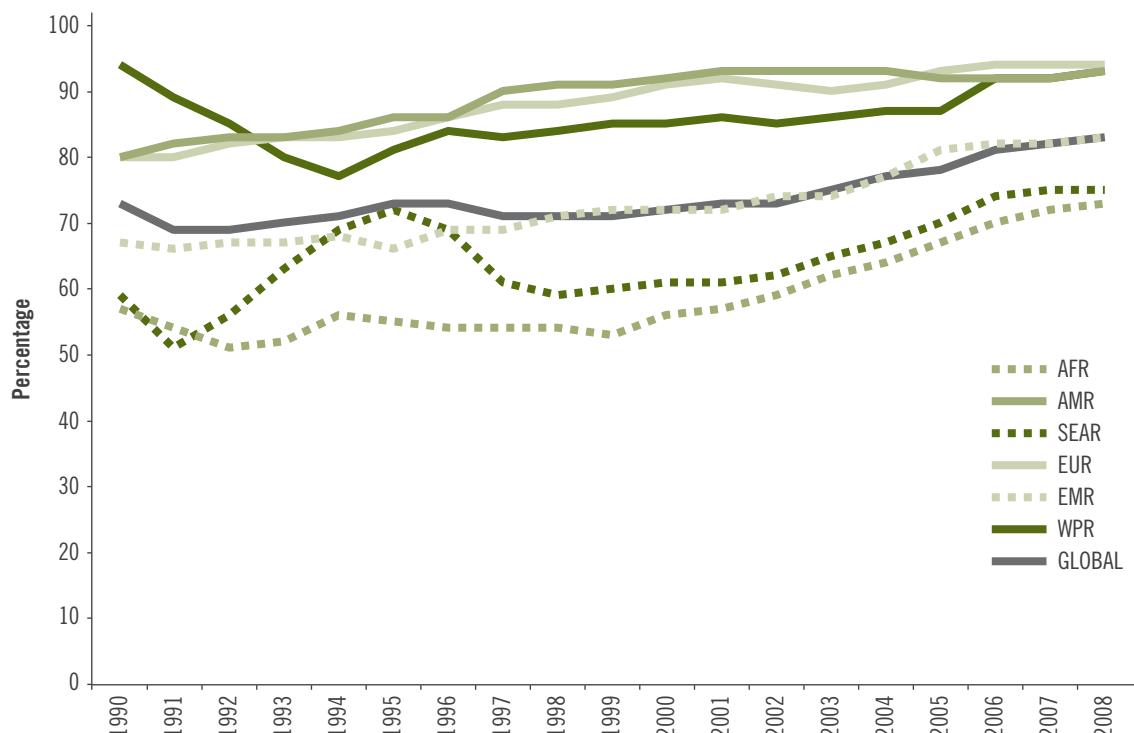

Despite these encouraging trends, regional and national averages mask considerable inequities. The greatest reductions in child mortality have been recorded among the wealthiest households and in urban areas. Concerted efforts will be needed to achieve the MDG target of a 67% reduction from 1990 levels by the year 2015, especially in countries facing economic crises or conflicts. Low-income countries would need to increase their annual average rate of decline from 1.9% to 10.9% in order to achieve the target. Reducing child mortality increasingly depends upon tackling neonatal mortality; globally about 40% of deaths in children under 5 years old are estimated to occur in the first month of life; most in the first week.

**Figure 1: Mortality rate in children under 5 years old by WHO region**

There have been increases in the coverage of relatively new **child health interventions**, such as the use of insecticide-treated nets to prevent malaria; efforts to prevent the mother-to-child transmission of HIV; and vaccination against hepatitis B and *Haemophilus influenzae* type B pneumonia. Gradual progress can also be recorded for several established interventions such as micronutrient supplementation, while the global coverage of measles immunization increased from 73% to 83% between 1990 and 2008 (Figure 2).

**Figure 2: Measles immunization coverage among 1-year-olds by WHO region**

Despite these gains, the coverage of critical interventions such as oral rehydration therapy (ORT) for diarrhoea and case management with antibiotics for acute respiratory infections (ARIs) remains inadequate. As a result, diarrhoea and pneumonia still kill almost 3 million children under 5 years old each year, especially in low-income countries.

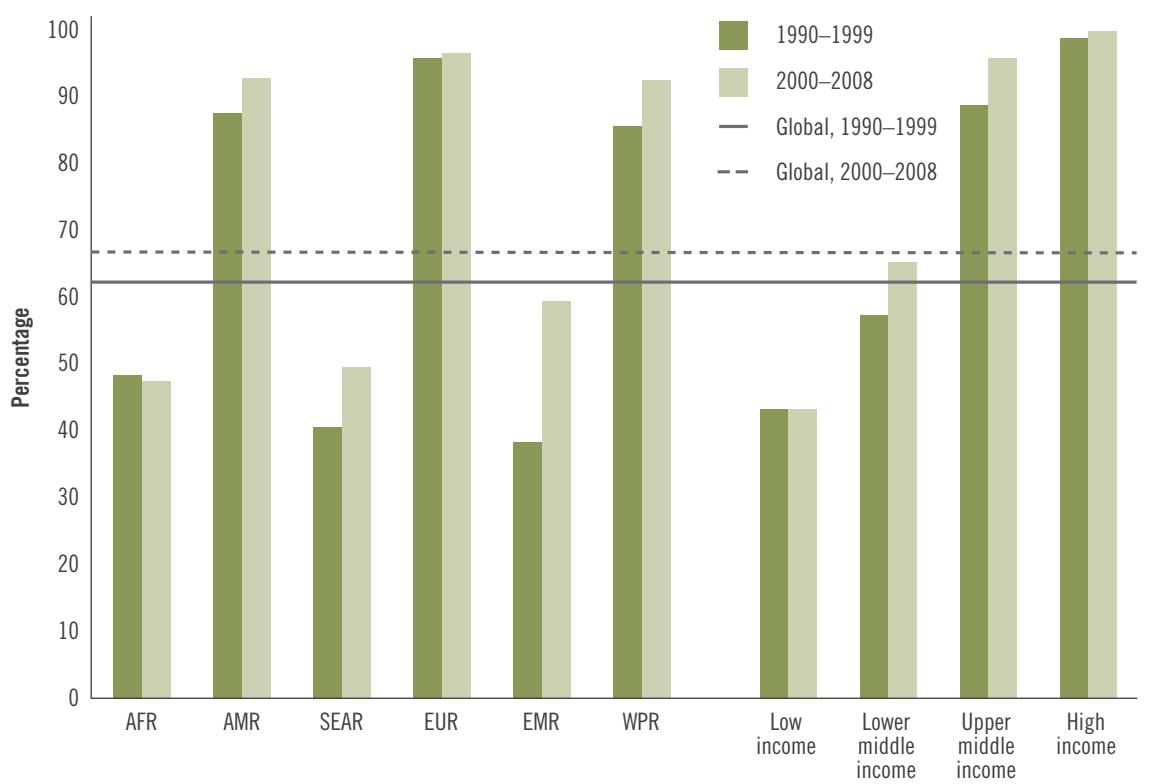

According to estimates made for the year 2005,<sup>4</sup> half a million women – most of them in developing countries – die each year of complications during pregnancy or childbirth. The risk of death was highest in the WHO African Region, where there were 900 maternal deaths per 100 000 live births; compared with only 27 per 100 000 in the WHO European Region. In fact, half of all maternal deaths occurred in the WHO African Region and another third in the WHO South-East Asia Region. Further analysis of the estimates indicated that between 1990 and 2005, no WHO region achieved the 5.5% annual decline in **maternal mortality** necessary to attain the relevant MDG target.<sup>5</sup> The WHO South-East Asia Region, the WHO European Region and the WHO Western Pacific Region showed annual declines of only around 2.4%. There appeared to be stagnation or even a possible worsening of the situation in both the WHO African Region and the WHO Eastern Mediterranean Region. Maternal mortality is the health indicator that shows the widest gaps between richer and poorer, both between and within countries.

<sup>4</sup> Maternal mortality in 2005: Estimates developed by WHO, UNICEF, UNFPA and The World Bank. Geneva, World Health Organization, 2007. [www.who.int/whosis/mme\\_2005.pdf](http://www.who.int/whosis/mme_2005.pdf)

<sup>5</sup> MDG 5: Target 5.A: Reduce by three quarters, between 1990 and 2015, the maternal mortality ratio.

Interventions to reduce the levels of maternal mortality include ensuring that all pregnant women have access to family-planning services as well as skilled care during pregnancy, childbirth and the postpartum period. This includes emergency obstetric care for the management of complications. The proportion of births attended by a skilled health worker has increased globally, with particularly pronounced improvements in the WHO Eastern Mediterranean Region (Figure 3). However, there was no improvement at all in the WHO African Region. In both the WHO African Region and the WHO South-East Asia Region, less than 50% of women received skilled care during childbirth.

**Figure 3: Births attended by skilled health personnel by WHO region and country-income group**

Antenatal care offers multiple opportunities to improve the health of women. Potential improvements include the prevention and management of HIV infection and malaria, the detection and management of eclampsia, and iron and folate supplementation – the latter being particularly important in low-income and middle-income countries where micronutrient deficiencies are common. Despite this, less than half of all pregnant women in the world receive the WHO-recommended minimum of four antenatal visits.

**Contraceptive prevalence**<sup>6</sup> in developing countries increased from 50% in 1990 to 62% in 2005.<sup>7</sup> Despite this, there remains a continuing unmet need for family planning. For example, data available during 2000–2008 indicates that in the WHO African Region 24% of women wanting to delay or stop childbearing were not using a family-planning method. Levels of adolescent fertility over the period of 2000–2007 were at 47 births per 1000 women aged 15–19 years globally, and were

<sup>6</sup> Defined here as: the proportion of women, married or in union, aged 15–49 years, using any method of contraception.

<sup>7</sup> *The Millennium Development Goals report 2009*. New York, United Nations, 2009.

[www.un.org/millenniumgoals/pdf/MDG%20Report%202009%20ENG.pdf](http://www.un.org/millenniumgoals/pdf/MDG%20Report%202009%20ENG.pdf)

particularly high in the WHO African Region at 118 births for every 1000 adolescent girls – about ten times the average in the WHO Western Pacific Region. Factors that contribute to continuing unmet need for family planning include a lack of decision-making power among women and a shortage of appropriate health services, especially for adolescent girls.

In 2008, there were an estimated 243 million cases of **malaria** causing 863 000 deaths; mostly of children under 5 years old.<sup>8</sup> Despite increases in the supply of insecticide-treated nets, their availability in that year was far below the level of need almost everywhere. The procurement of antimalarial medicines through public health services increased, but access to treatment (especially artemisinin-based combination therapy) was inadequate in all countries surveyed in 2007 and 2008. There are, however, indications<sup>8</sup> that 9 African countries and 29 countries outside Africa are on course to meet the MDG target<sup>9</sup> for reducing the malaria burden.

Latest estimates indicate that the incidence rate of **tuberculosis** (TB) continued to slowly decline, reaching an estimated 140 per 100 000 population in 2008. The prevalence of all TB cases is falling along with mortality rates among HIV-negative TB cases. Globally, the estimated case-detection rate<sup>10</sup> for new smear-positive TB cases increased from 40% in 2000 to 62% in 2008. While there were some improvements in the WHO African Region, less than 50% of TB cases were reported in this region in 2008.

Data on treatment-success rates for new smear-positive TB cases indicate consistent improvements with the global rate rising from 69% in 2000 to 86% in 2007 (Figure 4). In the WHO South-East Asia Region, the rate increased from 50% in 2000 to 88% in 2007. In the WHO European Region, while case-detection rate for new smear-positive cases increased, treatment success remains low at 67% in 2007, partly attributable to a high burden of multidrug-resistant TB. Multidrug-resistant TB and HIV-associated TB pose considerable challenges. Globally, there were an estimated 0.5 million new cases of multidrug-resistant TB in 2007, with 27 countries accounting for 85% of the total.<sup>11</sup>

New **HIV** infections have been reduced by 16% globally between 2000 and 2008, due, at least in part, to successful HIV-prevention efforts. In 2008, it was estimated that 2.7 million people were newly infected with HIV (Figure 5) and there were 2 million **HIV/AIDS**-related deaths.<sup>12</sup>

The availability and coverage of priority health-sector interventions for HIV prevention, treatment and care have continued to expand. In 2008, of the 1.4 million HIV-positive pregnant women, more than 628 000 received antiretroviral therapy (ART) to prevent the transmission of HIV to their children. This represents a coverage of 45% – an increase of 10% compared with 2007.<sup>13</sup> There are, however, striking regional variations. In the WHO African Region (where HIV prevalence among adults was the highest) only 45% of pregnant women in need in low-income and middle-income countries received treatment, while in the WHO European Region (where HIV prevalence among adults was much lower) 94% of pregnant women in need in low-income and middle-income countries had access to treatment.

<sup>8</sup> *World malaria report 2009*. Geneva, World Health Organization, 2009. [www.who.int/malaria/world\\_malaria\\_report\\_2009/en/index.html](http://www.who.int/malaria/world_malaria_report_2009/en/index.html)

<sup>9</sup> MDG 6; Target 6.C: Have halted by 2015 and begun to reverse the incidence of malaria and other major diseases.

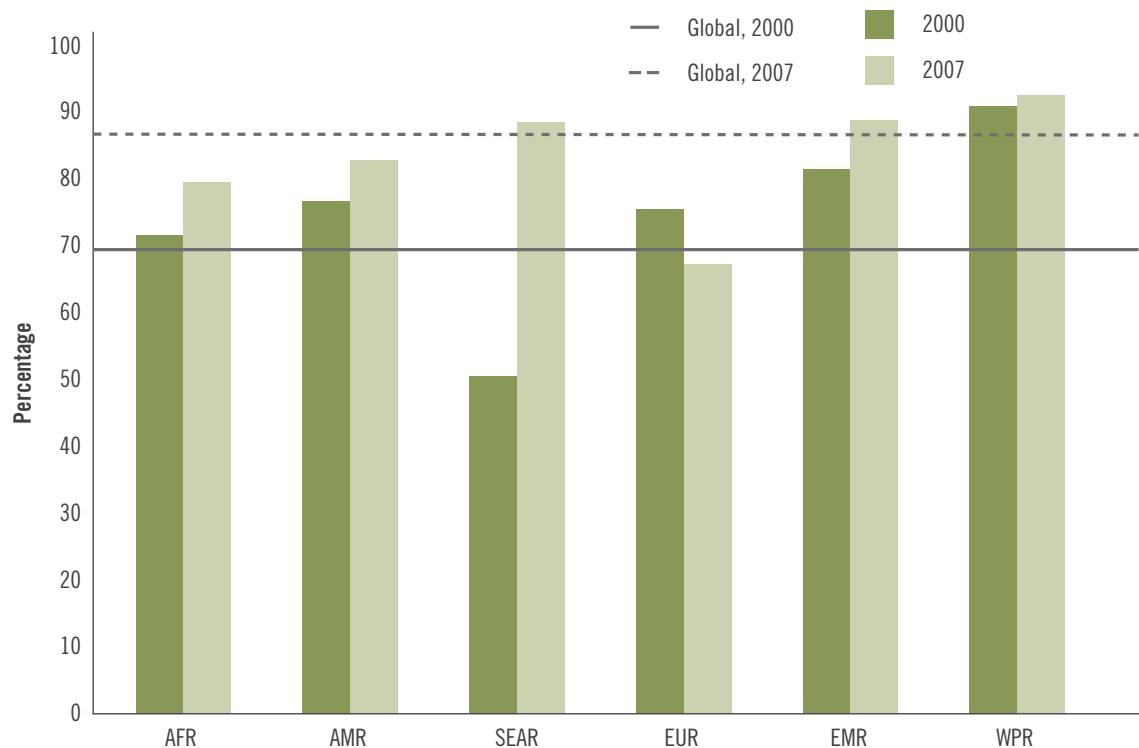

<sup>10</sup> No distinction is made between DOTS and non-DOTS programmes because by 2007 more than 99% of notified cases were reported to WHO as treated in a DOTS programme. *Global tuberculosis control: a short update to the 2009 report*. **Figure 4: Treatment-success rate among new smear-positive tuberculosis cases by WHO region**

**Figure 5: Adults and children newly infected with HIV in 2008 by WHO region**

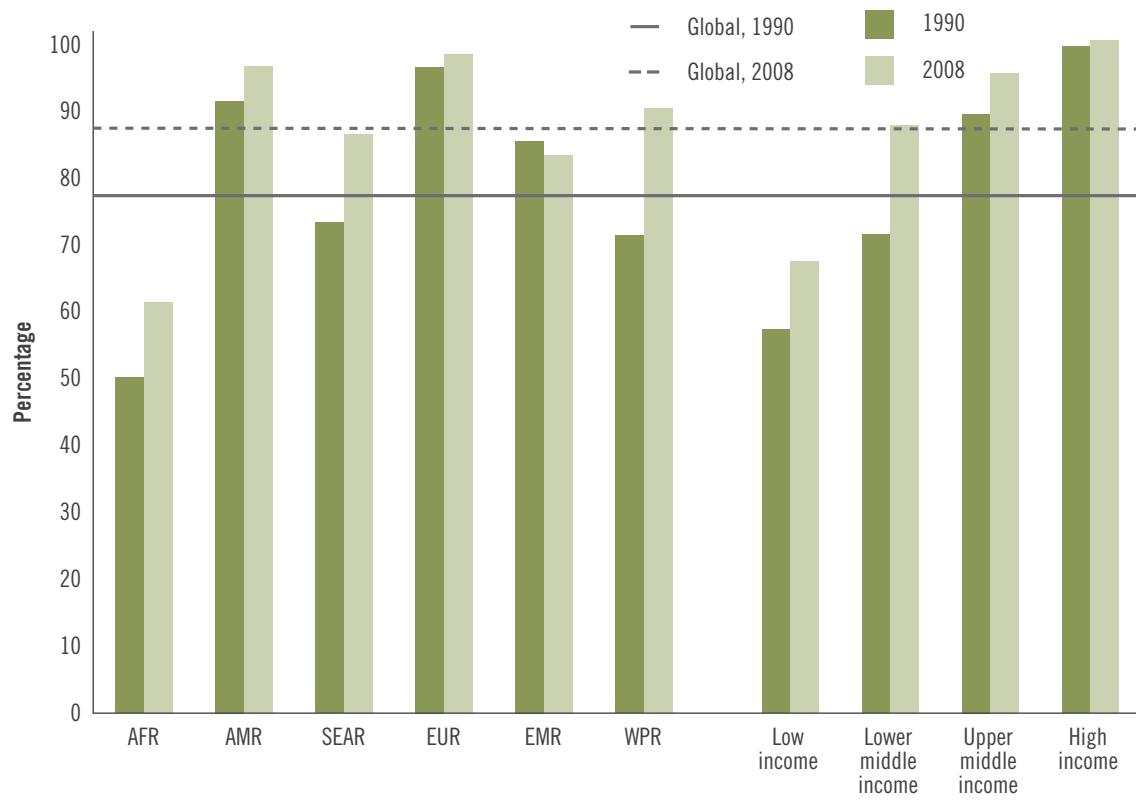

It is estimated that by the end of 2008, more than 4 million people in low-income and middle-income countries were receiving ART – an increase of more than 1 million compared with the end of 2007. This represents a 10-fold expansion in five years, with the greatest growth occurring in sub-Saharan Africa. Nonetheless, more than 5 million of the estimated 9.5 million people in low-income and middle-income countries needing ART were still without access to treatment.<sup>13</sup> Coverage was lowest in the WHO Eastern Mediterranean Region (where only one in every 10 people needing ART received it) and highest in the WHO Region of the Americas (where one out of two who needed therapy received it).

More than 1000 million people are affected by **neglected tropical diseases**. In 2008, 496 million people were treated for lymphatic filariasis out of the 695 million targeted. In 2008, only 4619 cases of dracunculiasis were reported – in the mid-1980s the estimated number of cases was 3.5 million. As many as 190 130 cases of cholera were reported in 2008 – up from 177 963 in 2007. At the beginning of 2009, there were a reported 213 036 cases of leprosy – down from 5.2 million in 1985.

The percentage of the world's population using "improved" **drinking-water sources**<sup>14</sup> increased from 77% to 87% between 1990 and 2008 (Figure 6). This rate of improvement is sufficient to achieve the relevant MDG target<sup>15</sup> globally. In the WHO African Region, however, while the percentage increased from 50% in 1990 to 61% in 2008, it remained well short of the 68% needed in that year to remain on course for achieving the MDG target. The situation in the WHO Eastern Mediterranean Region appears to have stalled, and an annual rate of increase of 1.6% is needed to

**Figure 6: Population using improved drinking-water sources by WHO region and country-income group**

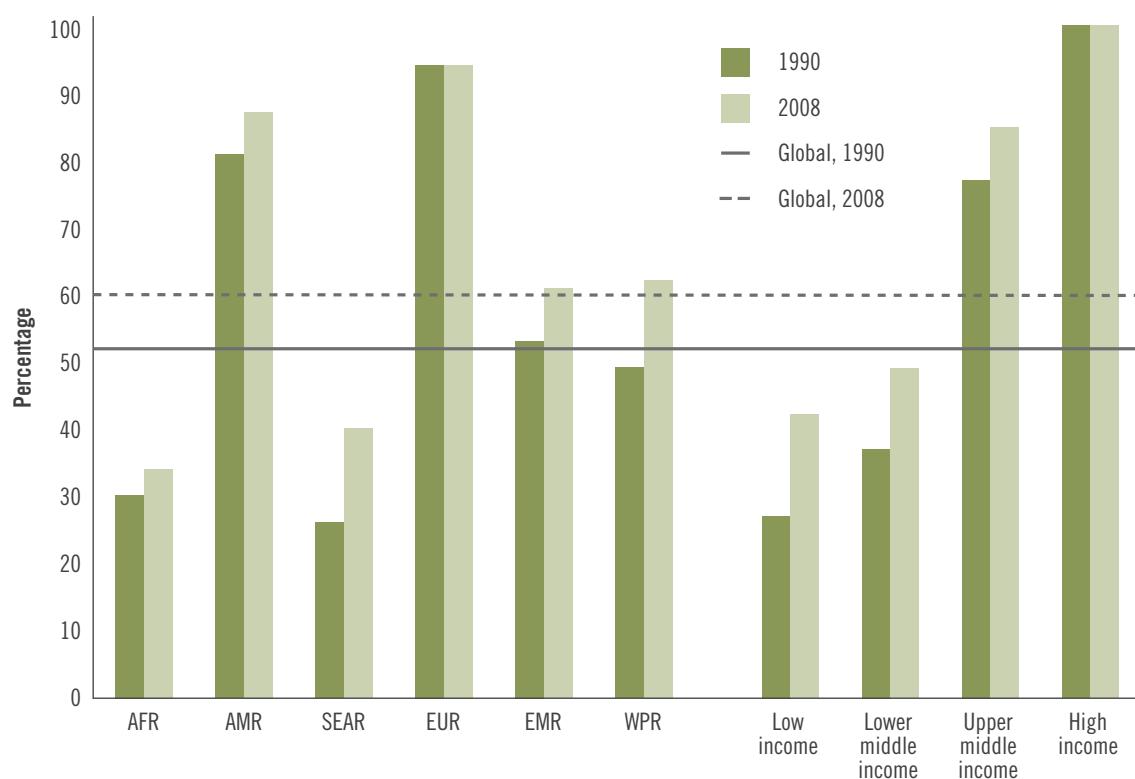

<sup>14</sup> See Part II, Table 5. Risk factors, footnotes 20 and 22 for a full explanation of this term.

<sup>15</sup> MDG 7; Target 7.C: Halve, by 2015, the proportion of people without sustainable access to safe drinking-water and basic sanitation.

achieve the MDG target by 2015. In 2008, the coverage was 90% in the WHO Western Pacific Region, and well in excess of this figure in the WHO Region of the Americas and the WHO European Region. In low-income countries, the annual rate of increase needs to double in order to reach the target, and concerted efforts are also needed to narrow the gap in coverage between urban and rural areas.

In 2008, 2600 million people were not using “improved” **sanitation** facilities,<sup>16</sup> and of these 1100 million were defecating in the open, resulting in high levels of environmental contamination and exposure to the risks of worm infestations (such as schistosomiasis) and microbial infections (such as trachoma, hepatitis and cholera). The situation was most severe in the WHO African Region, where the percentage of the population using improved sanitation facilities increased very slowly: from 30% in 1990 to 34% in 2008. In the WHO South-East Asia Region, the coverage increased from 26% to 40% – still short of the MDG target. In the WHO European Region, 6% of the population were not using improved sanitation facilities in 2008 (Figure 7).

**Figure 7: Population using improved sanitation facilities by WHO region and country-income group**

Although nearly all countries publish an **essential medicines** list, the availability of medicines at public-health facilities is often poor. Surveys conducted in approximately 30 low-income countries indicate that the availability of selected generic medicines at health facilities was only 44% in the public sector and 66% in the private sector. Lack of medicines in the public sector forces patients to purchase medicines privately. In the private sector, generic medicines cost on average 630% more

<sup>16</sup> See Part II, Table 5. Risk factors, footnotes 21 and 22 for a full explanation of this term.

than their international reference price, while originator brands are generally even more expensive. Common treatment regimens can cost a low-paid government worker in the developing world several days' wages.

**Noncommunicable diseases and injuries** caused an estimated 33 million deaths in developing countries in 2004<sup>17</sup> and will account for a growing proportion of total deaths in the future. The health of individuals will also be undermined in the longer term by chronic conditions, sensory and mental disorders and violence. Tackling risk factors such as tobacco use, unhealthy diets, physical inactivity and the harmful use of alcohol (while also dealing with the socioeconomic impact of cardiovascular diseases, cancers, chronic respiratory diseases and diabetes) will depend not only upon effective health-care services but also upon actions taken in a variety of policy domains. Countries need to increase prevention efforts and improve access to services such as early detection and trauma care. Putting in place and sufficiently resourcing stronger health surveillance systems will be critical. Efforts are now under way to strengthen surveillance systems for noncommunicable diseases, including through the identification of core indicators and the use of standardized methods of data collection on risk factors and determinants, disease incidence, mortality by cause, health-system indicators and coverage of key interventions.

Stronger health systems will be central to continued progress towards the achievement of the MDGs. Continuing political momentum and sustained and predictable funding will be needed to strengthen human resources for health; improve service availability and quality; provide access to diagnosis through national laboratory networks; ensure better infection control in clinical settings; and promote the rational use of medicines. In addition, the financial and economic crisis has highlighted the urgent need to increase the coverage of social health protection. People in need cannot access the required services or continue treatment if financial barriers remain high.

Better information and intelligence will also be essential in monitoring progress towards the MDGs and related goals and targets, particularly with regard to differentials between and within countries. WHO will continue to report on the most-recent estimates of health-related statistics. However, the quality of such reporting depends critically upon the quality of country health information and statistical systems – which in many settings are weak. There is therefore a need for international commitment to support country efforts to enhance the availability and quality of data on the MDGs and other indicators.

<sup>17</sup> *The global burden of disease: 2004 update*. Geneva, World Health Organization, 2008.  
[www.who.int/healthinfo/global\\_burden\\_disease/2004\\_report\\_update/en/index.html](http://www.who.int/healthinfo/global_burden_disease/2004_report_update/en/index.html)

The following charts provide country-by-country and regional summaries of progress for key MDG indicators for which data are available for most countries. For each indicator, countries are sorted within the relevant WHO region by the level of the indicator at the latest available year. Countries with no data, or for which a particular indicator is not relevant, are included at the end of each regional list.

Depending on the availability of data for each indicator, there are three types of chart:

#### **Chart type I**

For three indicators – under-five mortality rate; population using improved drinking-water sources; and population using improved sanitation – the charts show data for the latest available year; trends since 1990 (or since the first year for which data are available); and the overall trend required for the country to achieve the relevant MDG by 2015.

#### **Chart type II**

For five indicators – children aged <5 years underweight; measles immunization coverage among 1-year-olds; births attended by skilled health personnel; prevalence of HIV among adults aged 15–49 years; and tuberculosis mortality rate among HIV-negative people – the charts show data for the latest available year, and country trends since the year for which data were first available. For most countries, data have been available since the baseline year of 1990.

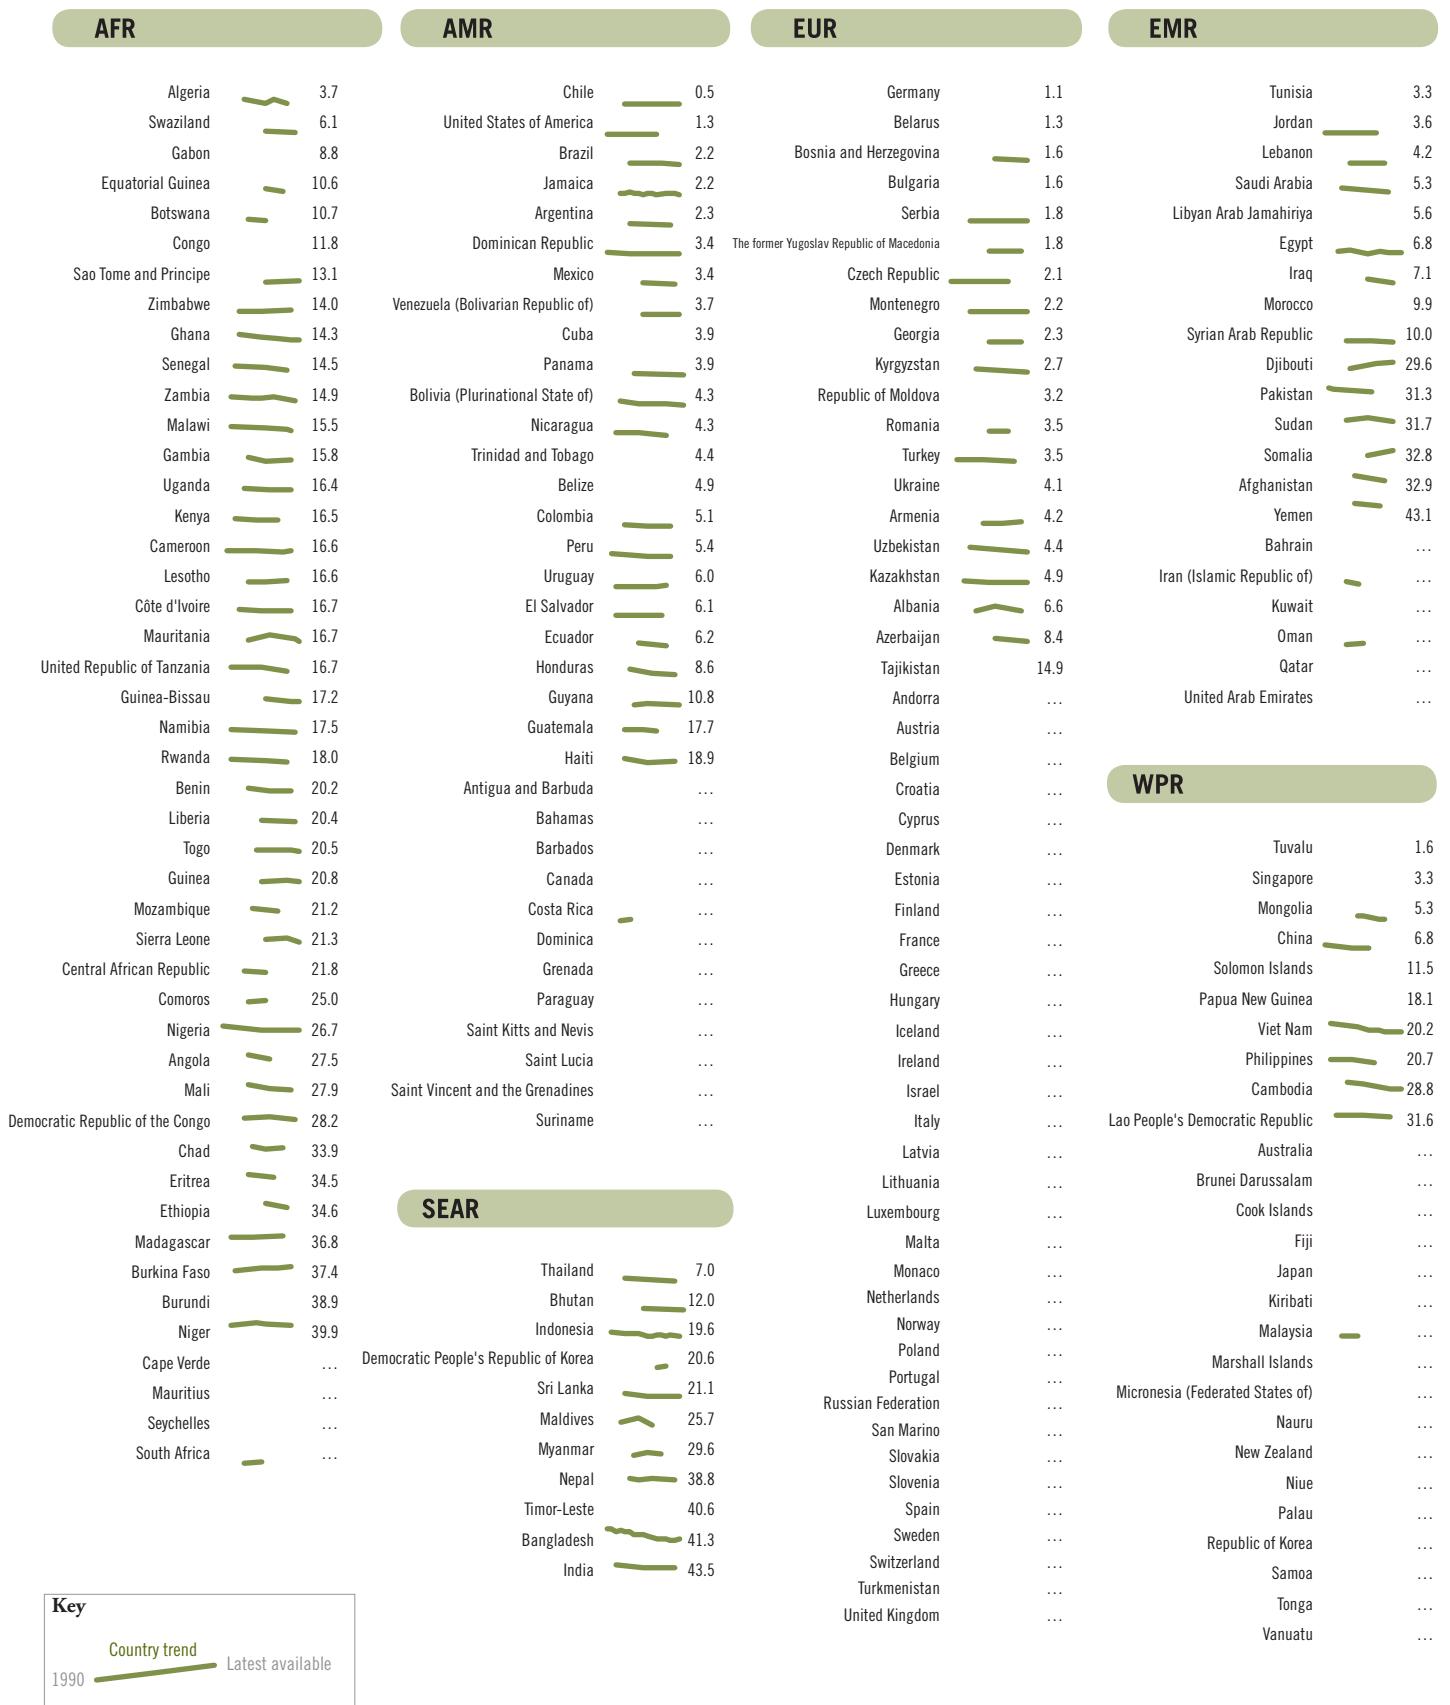

#### **Chart type III**

For eleven indicators – maternal mortality ratio; contraceptive prevalence; adolescent fertility rate; antenatal care coverage; unmet need for family planning; males aged 15–24 years with comprehensive correct knowledge of HIV/AIDS; females aged 15–24 years with comprehensive correct knowledge of HIV/AIDS; antiretroviral therapy coverage among people with advanced HIV infection; malaria mortality rate; children aged <5 years sleeping under insecticide-treated nets; and children aged <5 years with fever who received treatment with any antimalarial – the charts show only data for the latest available year.

Further details can be found in the country tables as indicated in each chart.

## 1. Children aged <5 years underweight (%)

This chart shows the percentage of children under 5 years old who are underweight in each country. Within each WHO region, countries are sorted by the latest available data since 2000.

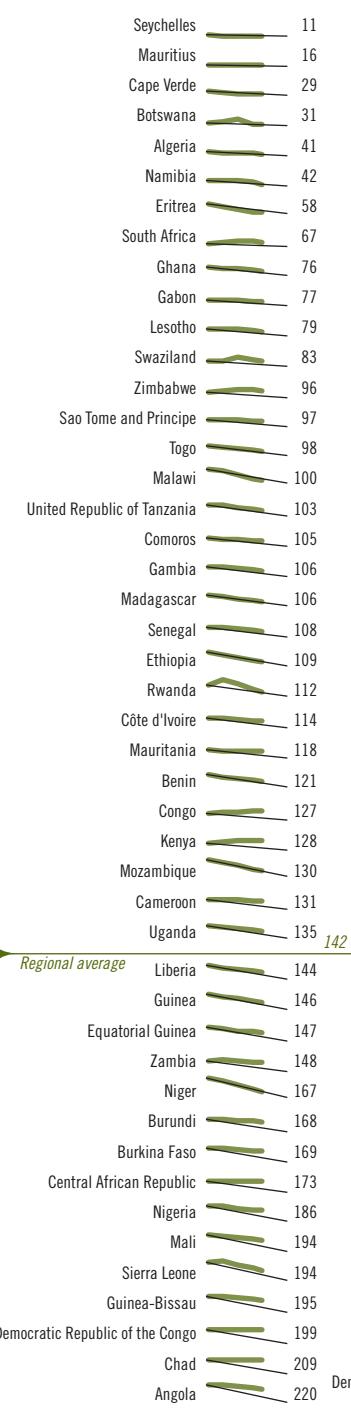

Within each WIFC region, countries are sorted by the latest available data since 2006. Regional averages are not available at this time.

Further details can be found in Part II, Table 5.

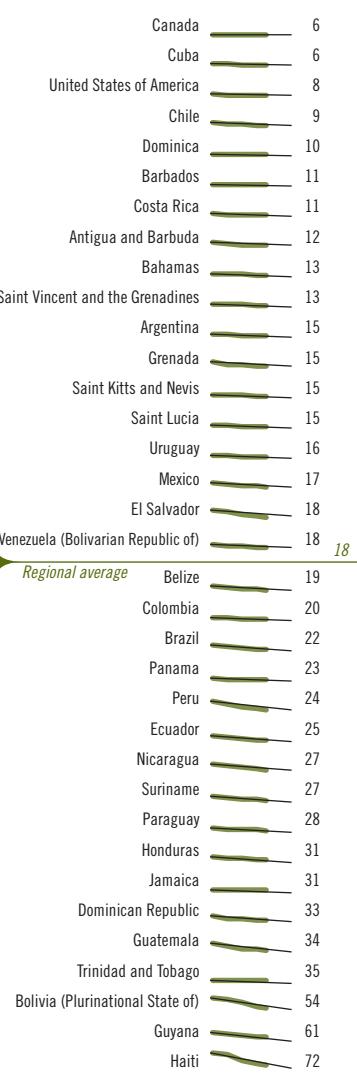

## 2. Under-five mortality rate (probability of dying by age 5 per 1000 live births)

62+2+5+9  
18+5+4  
30+3+3  
81.4%

### WPR

### SEAR

This chart shows estimated under-five mortality for 2008, with countries within each WHO region sorted by level.

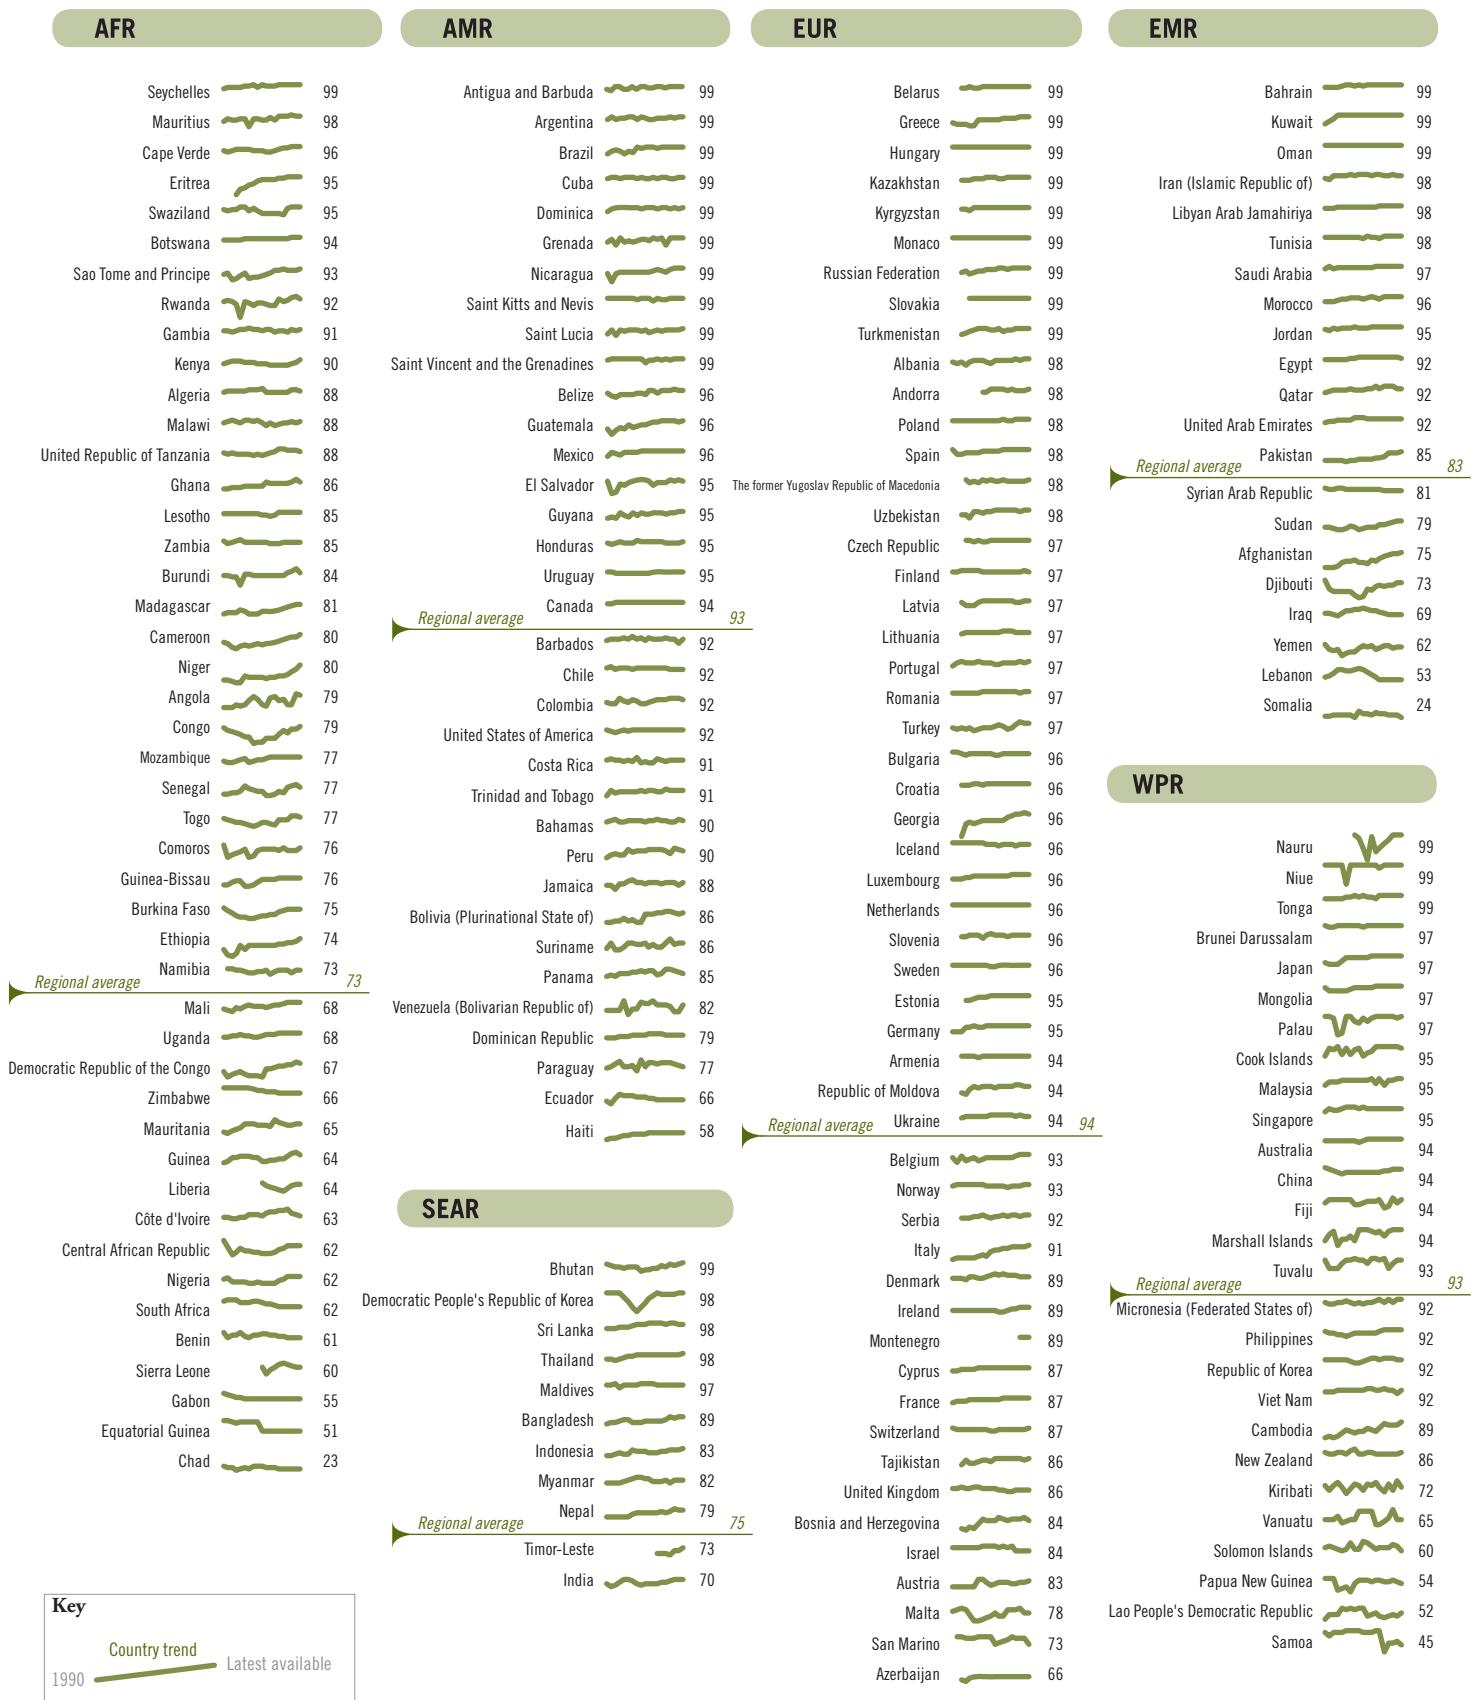

The bold lines indicate trends since 1990 or since the first year for which data are available.

The thin lines indicate the projected trend needed to reduce by two thirds the under-five mortality rate by 2015.

Further details can be found in Part II, Table 1.

### 3. Measles immunization coverage among 1-year-olds (%)

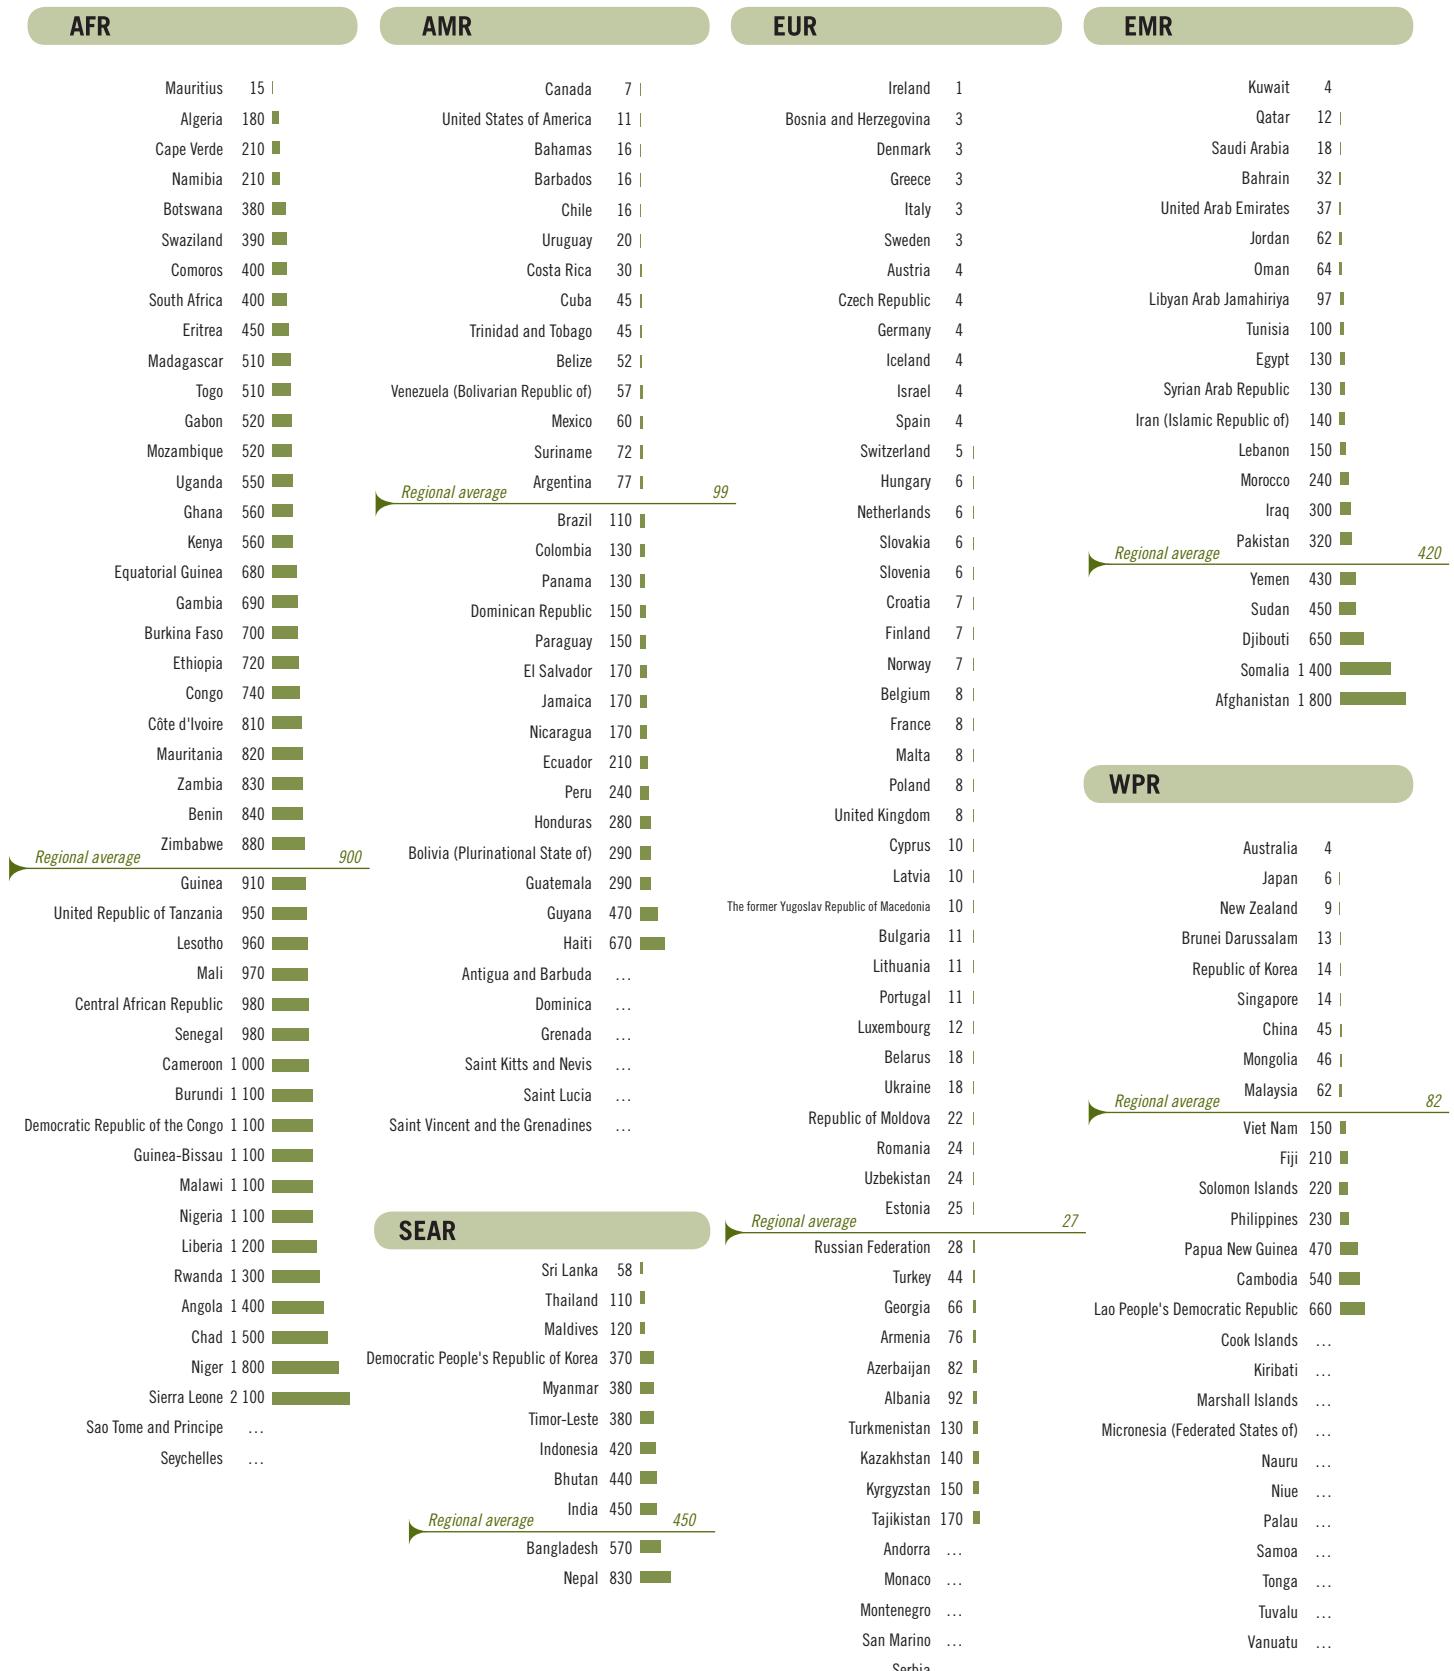

62+2+5+9+4  
10+3+18+5+4  
3+1+4+1+3

This chart shows the percentage of 1-year-olds fully immunized against measles, with countries within each WHO region sorted by 2008 level.

Further details can be found in Part II, Table 4.

#### 4. Maternal mortality ratio (per 100 000 live births)

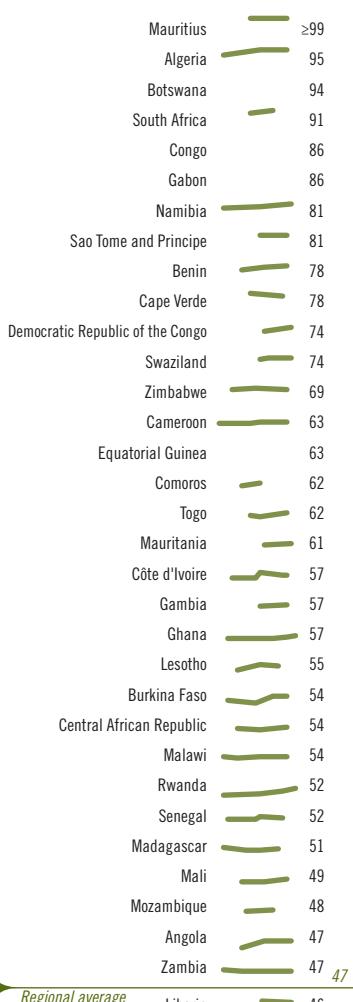

This chart shows the interagency estimated maternal mortality ratio for each country for 2005, with countries within each WHO region sorted by level. Further details can be found in [Part II, Table 2](#).

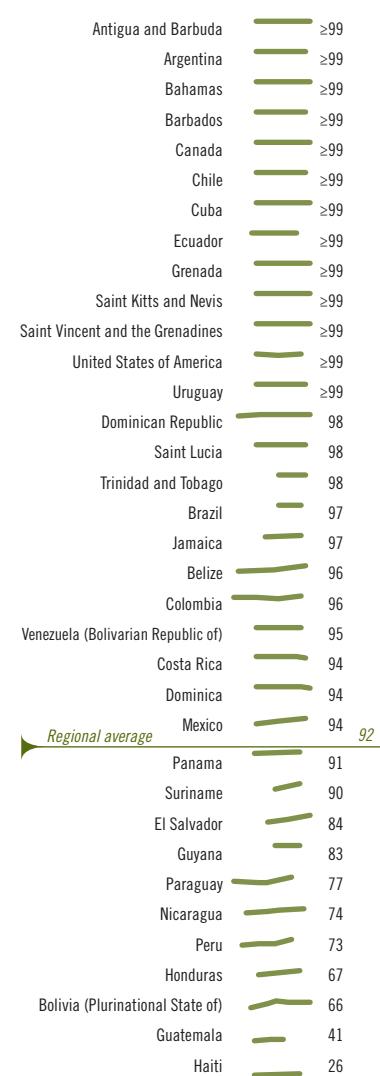

## 5. Births attended by skilled health personnel (%)

This chart shows estimated adolescent fertility expressed as the number of births among girls aged 15–19 years per 1000 girls in this age group per year. Within each WHO region, countries are sorted by the latest available data since 2000.

Further details can be found in Part II, Table 9.

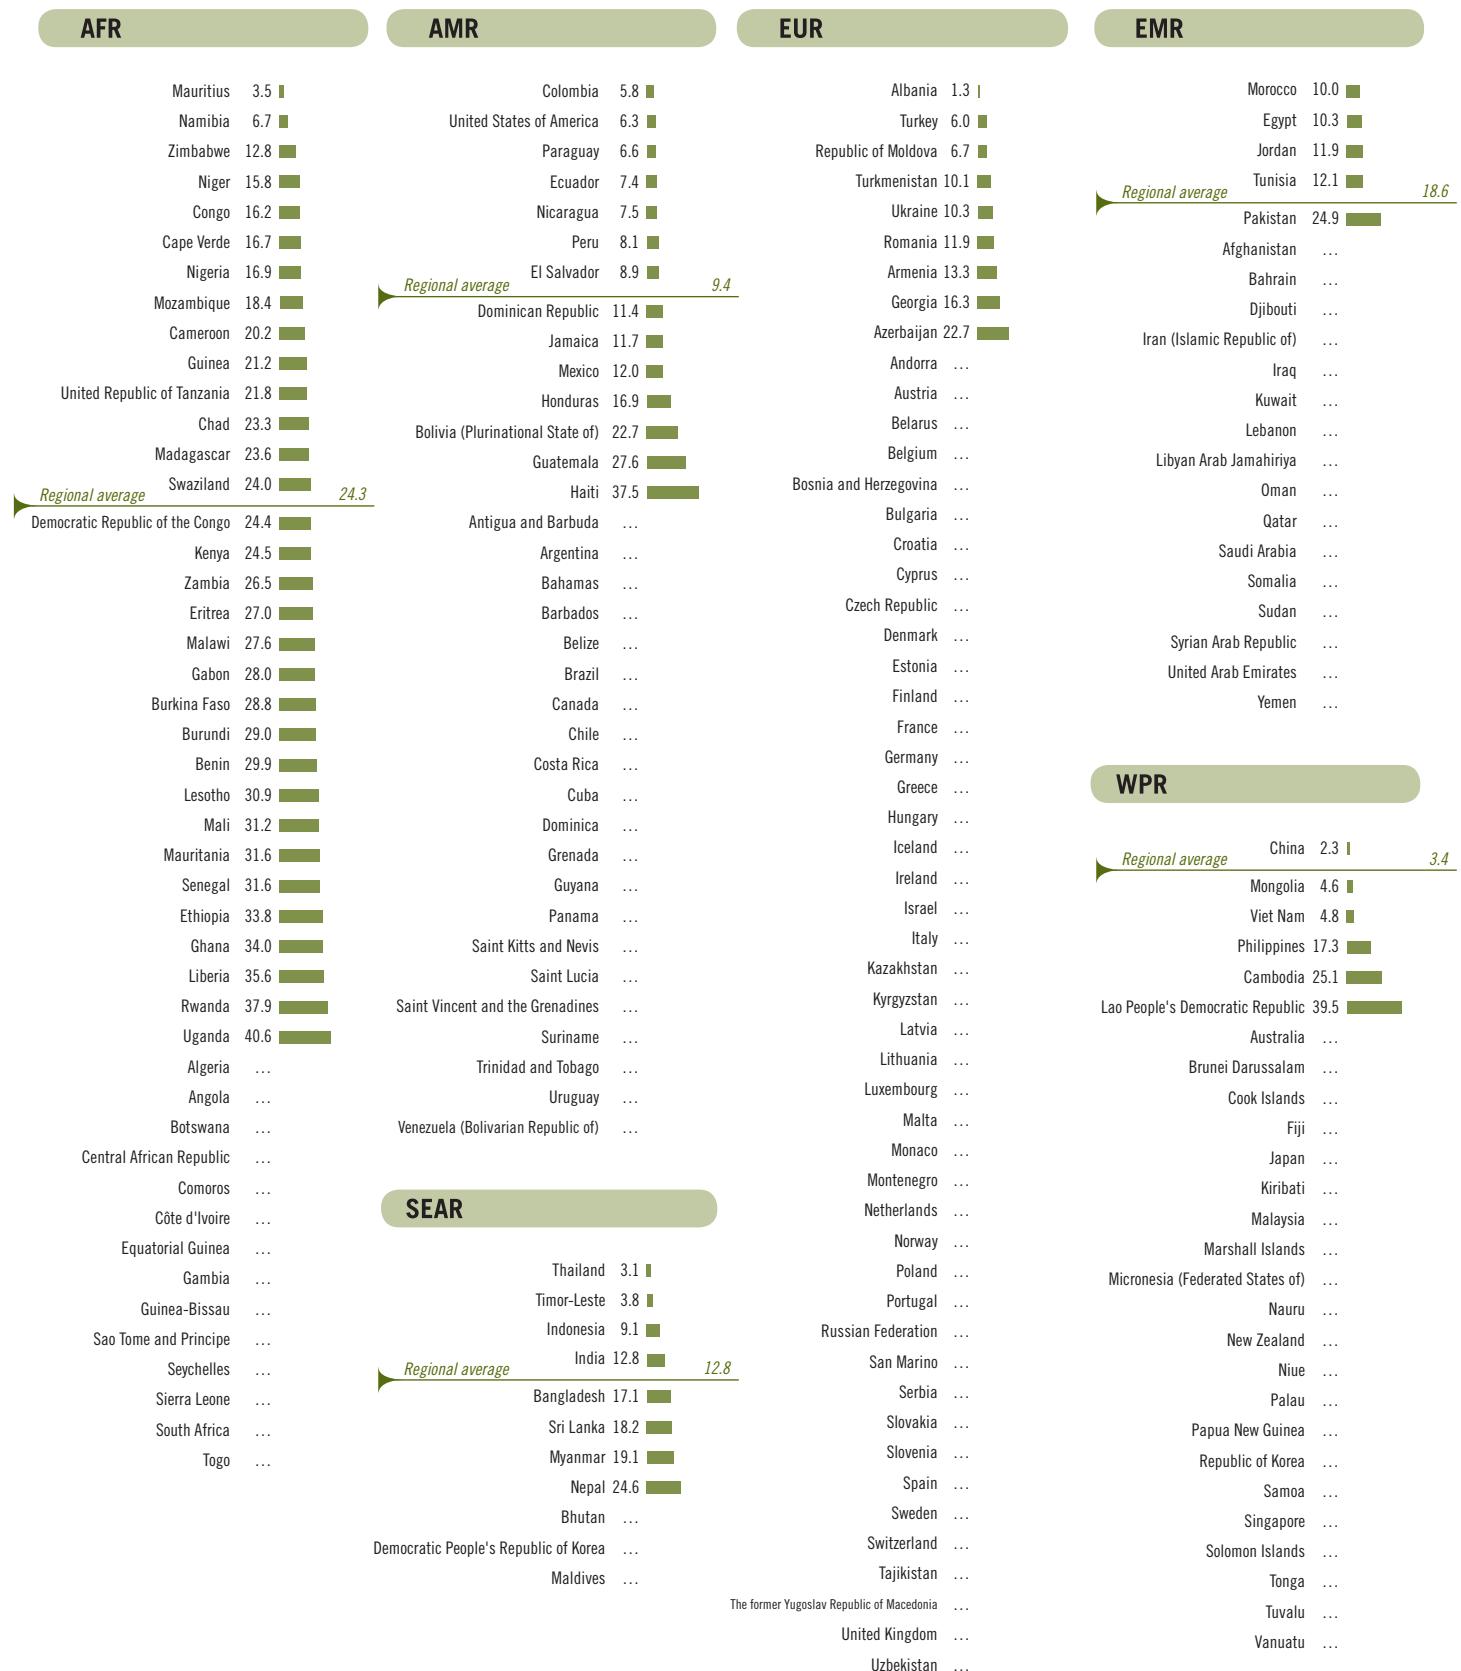

## 8. Antenatal care coverage (%): at least 1 visit and at least 4 visits

This chart shows the percentage of women who received antenatal care from skilled health personnel at least once and at least four times during pregnancy. Within each WHO region, countries are sorted by the latest available data since 2000 for coverage of at least one visit.

Further details can be found in Part II, Table 4.

## 9. Unmet need for family planning (%)

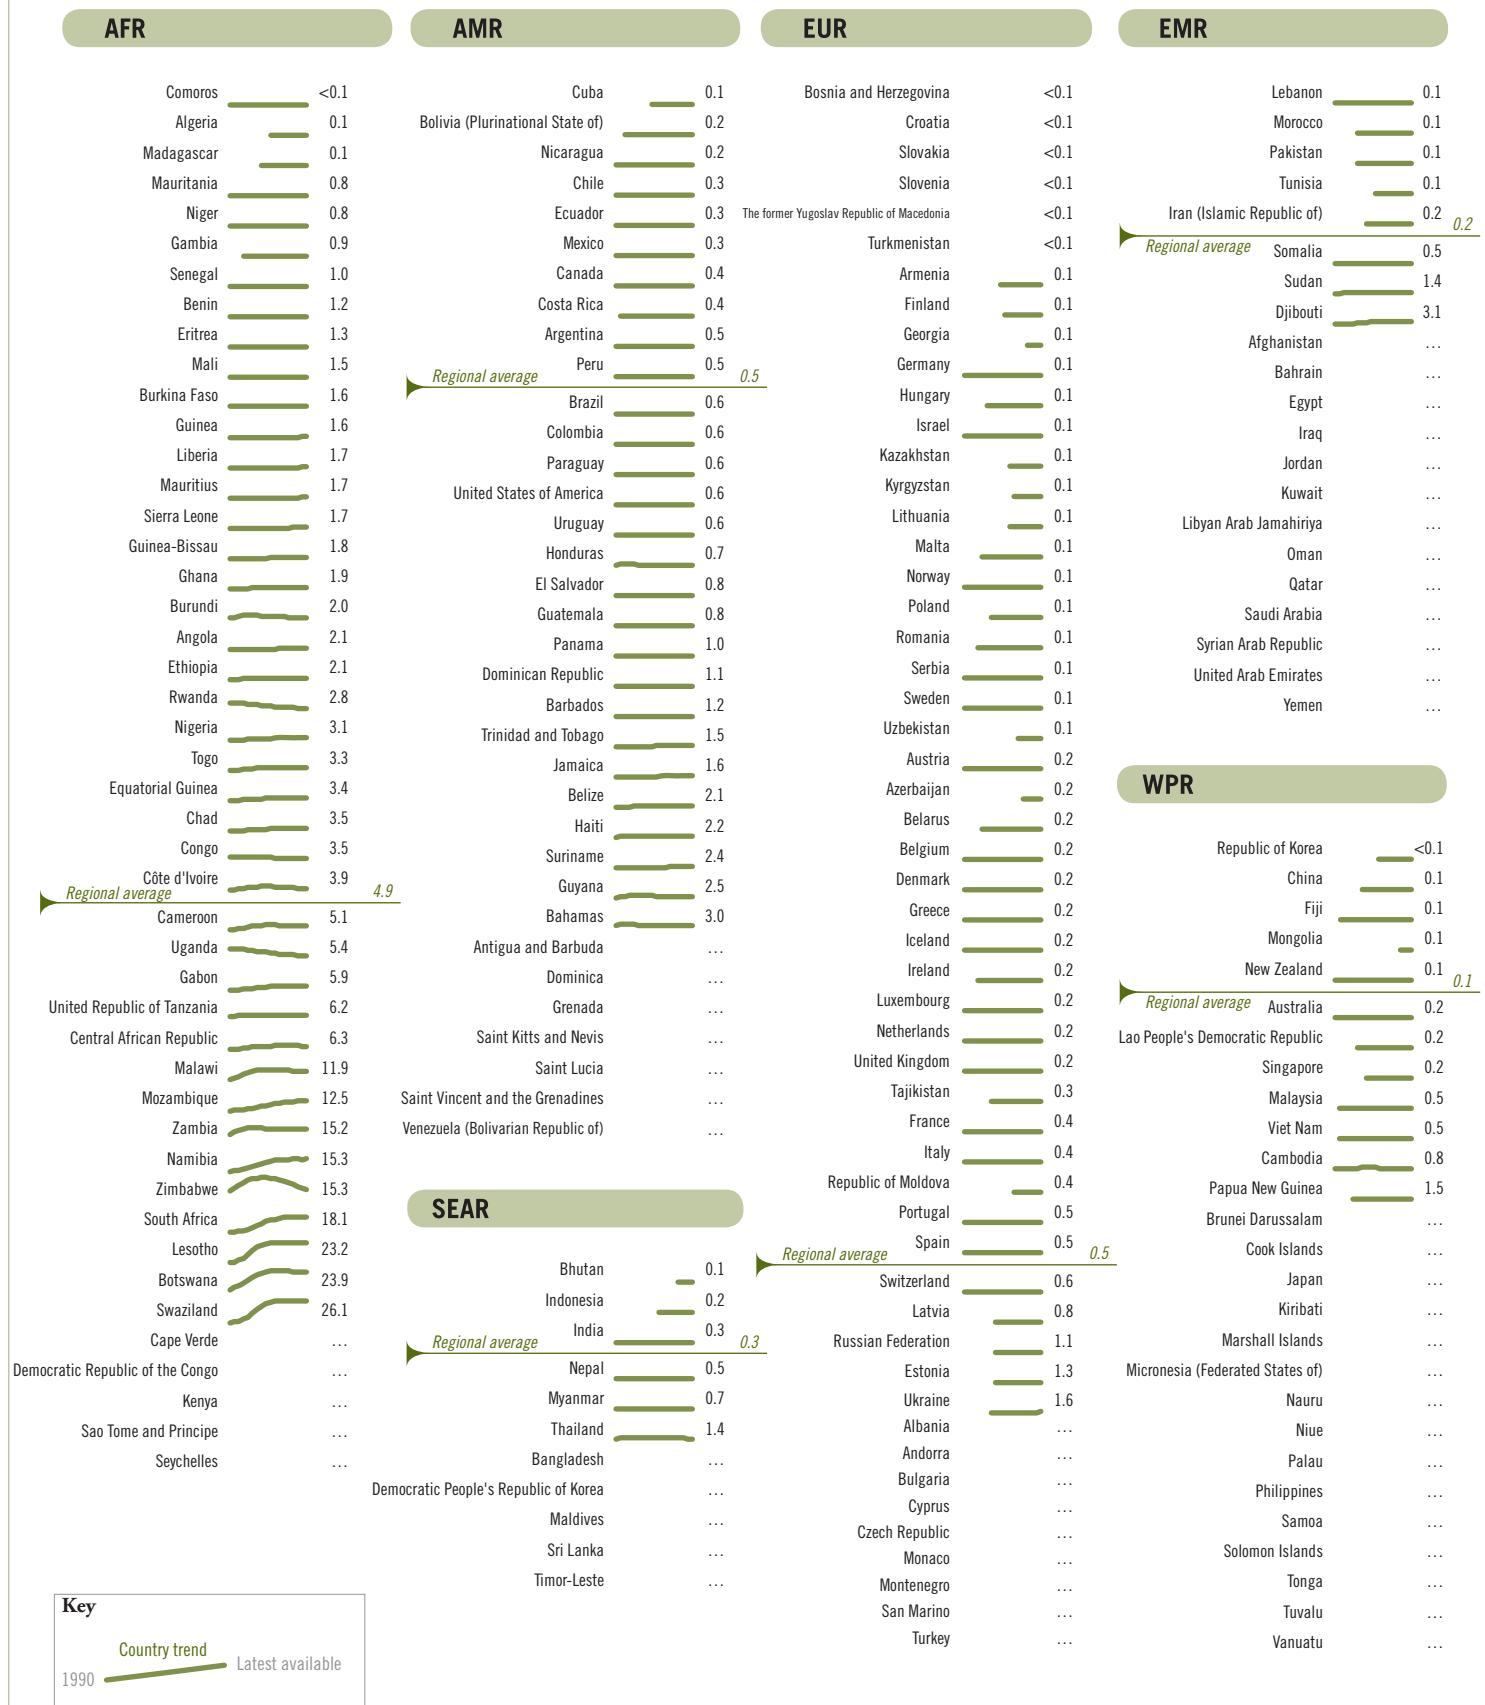

This chart shows the percentage of women who are fecund and sexually active but are not using any method of contraception, and report not wanting any more children or wanting to delay the next child.

Within each WHO region, countries are sorted by the latest available data since 2000.

Further details can be found in **Part II, Table 4**.

81.4% CL 3

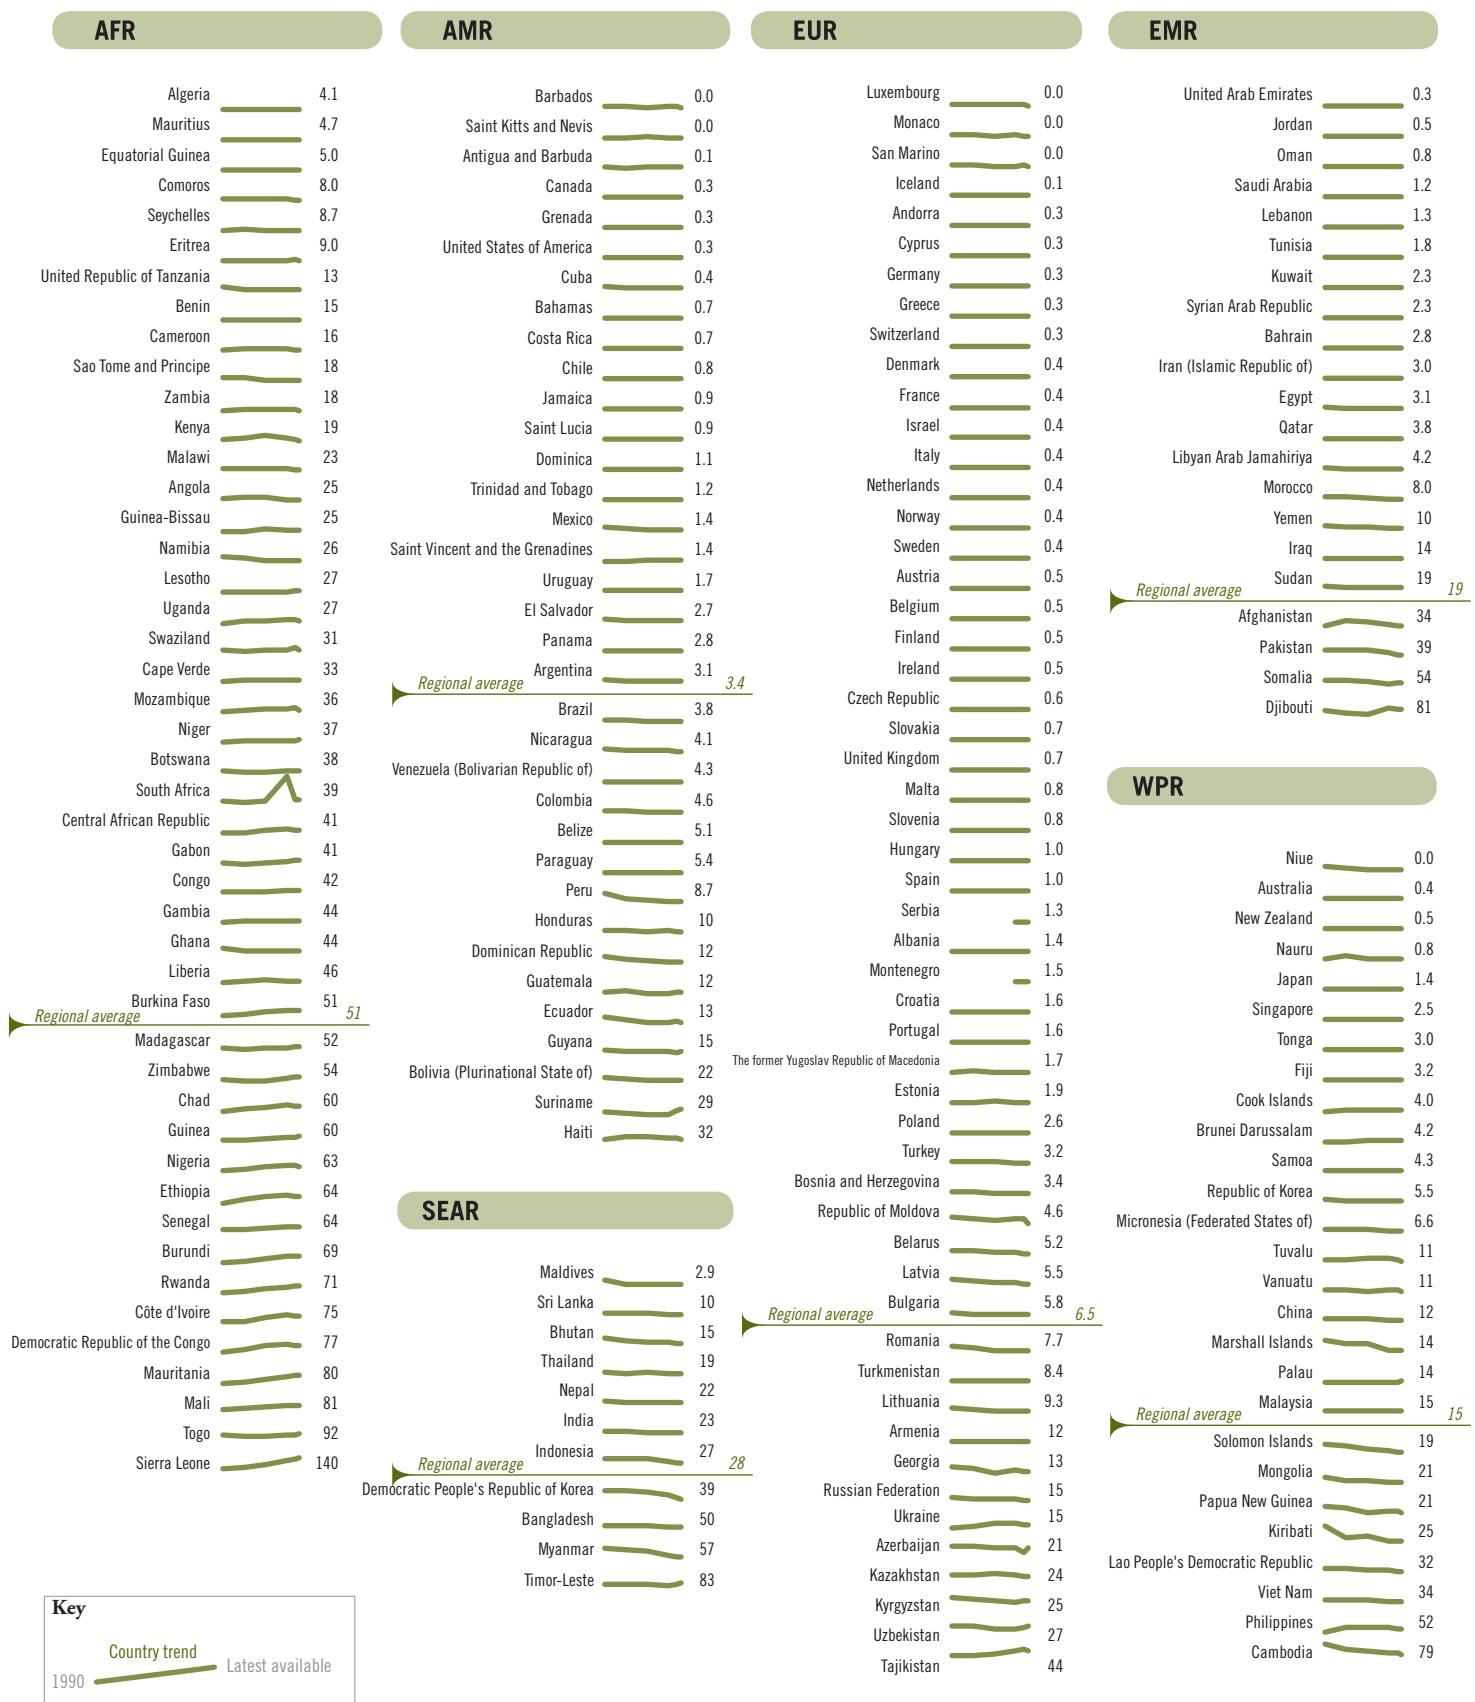

This chart shows the percentage of children under 5 years of age with fever in the two weeks prior to the survey who received any antimalarial medicine. Within each WHO region, countries are sorted by the latest available data since 2000.

Further details can be found in Part II, Table 4.

## 17. Tuberculosis mortality rate among HIV-negative people (per 100 000 population)

3+

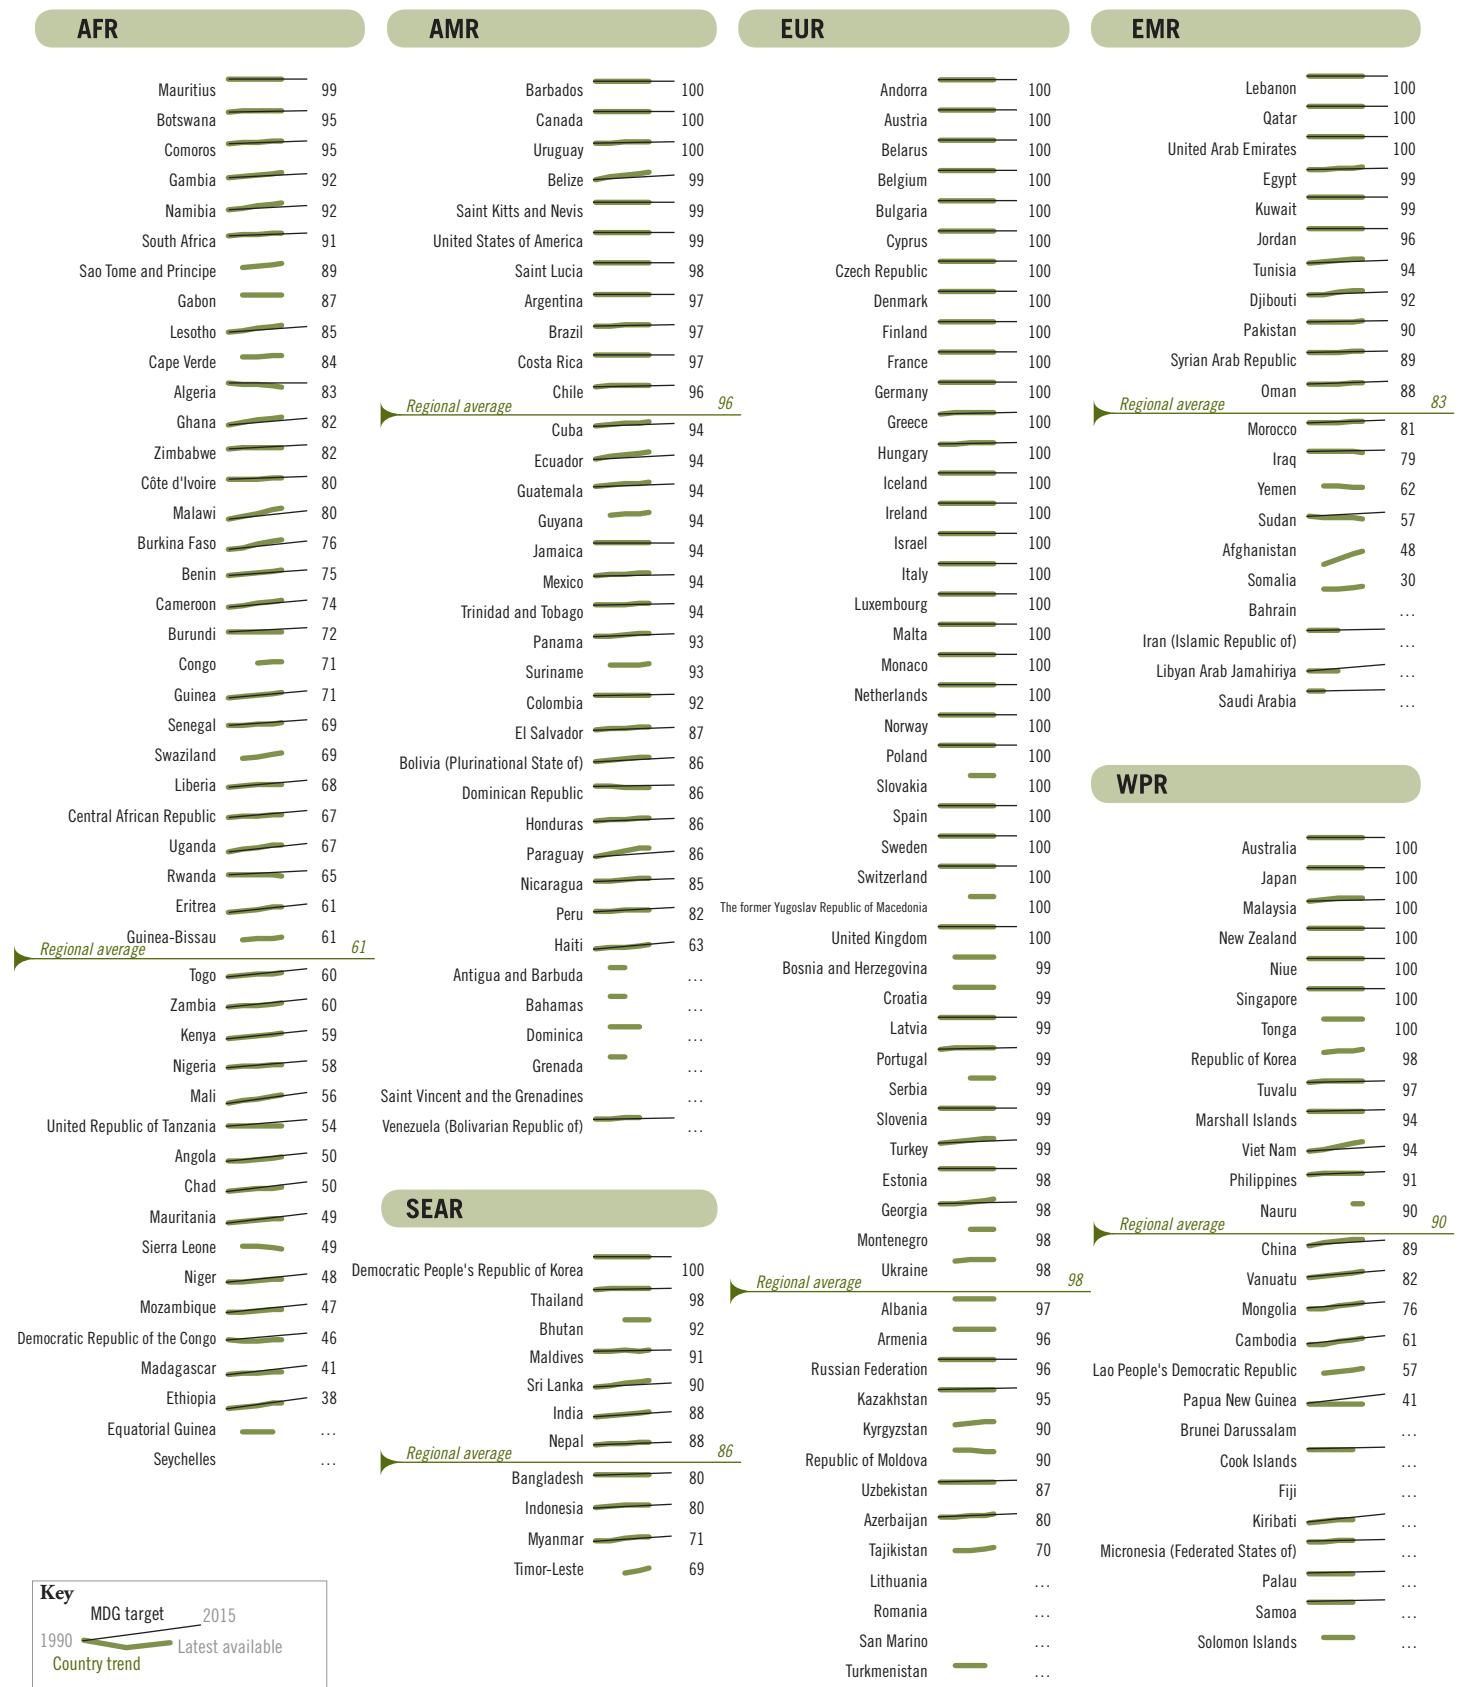

This chart shows the estimated number of deaths (per 100 000 population) from tuberculosis among HIV-negative cases for 2008, with countries within each WHO region sorted by level.

Further details can be found in Part II, Table 4.

## 18. Population using improved drinking-water sources (%)

62+25+18+5+4  
31.4% CL-3

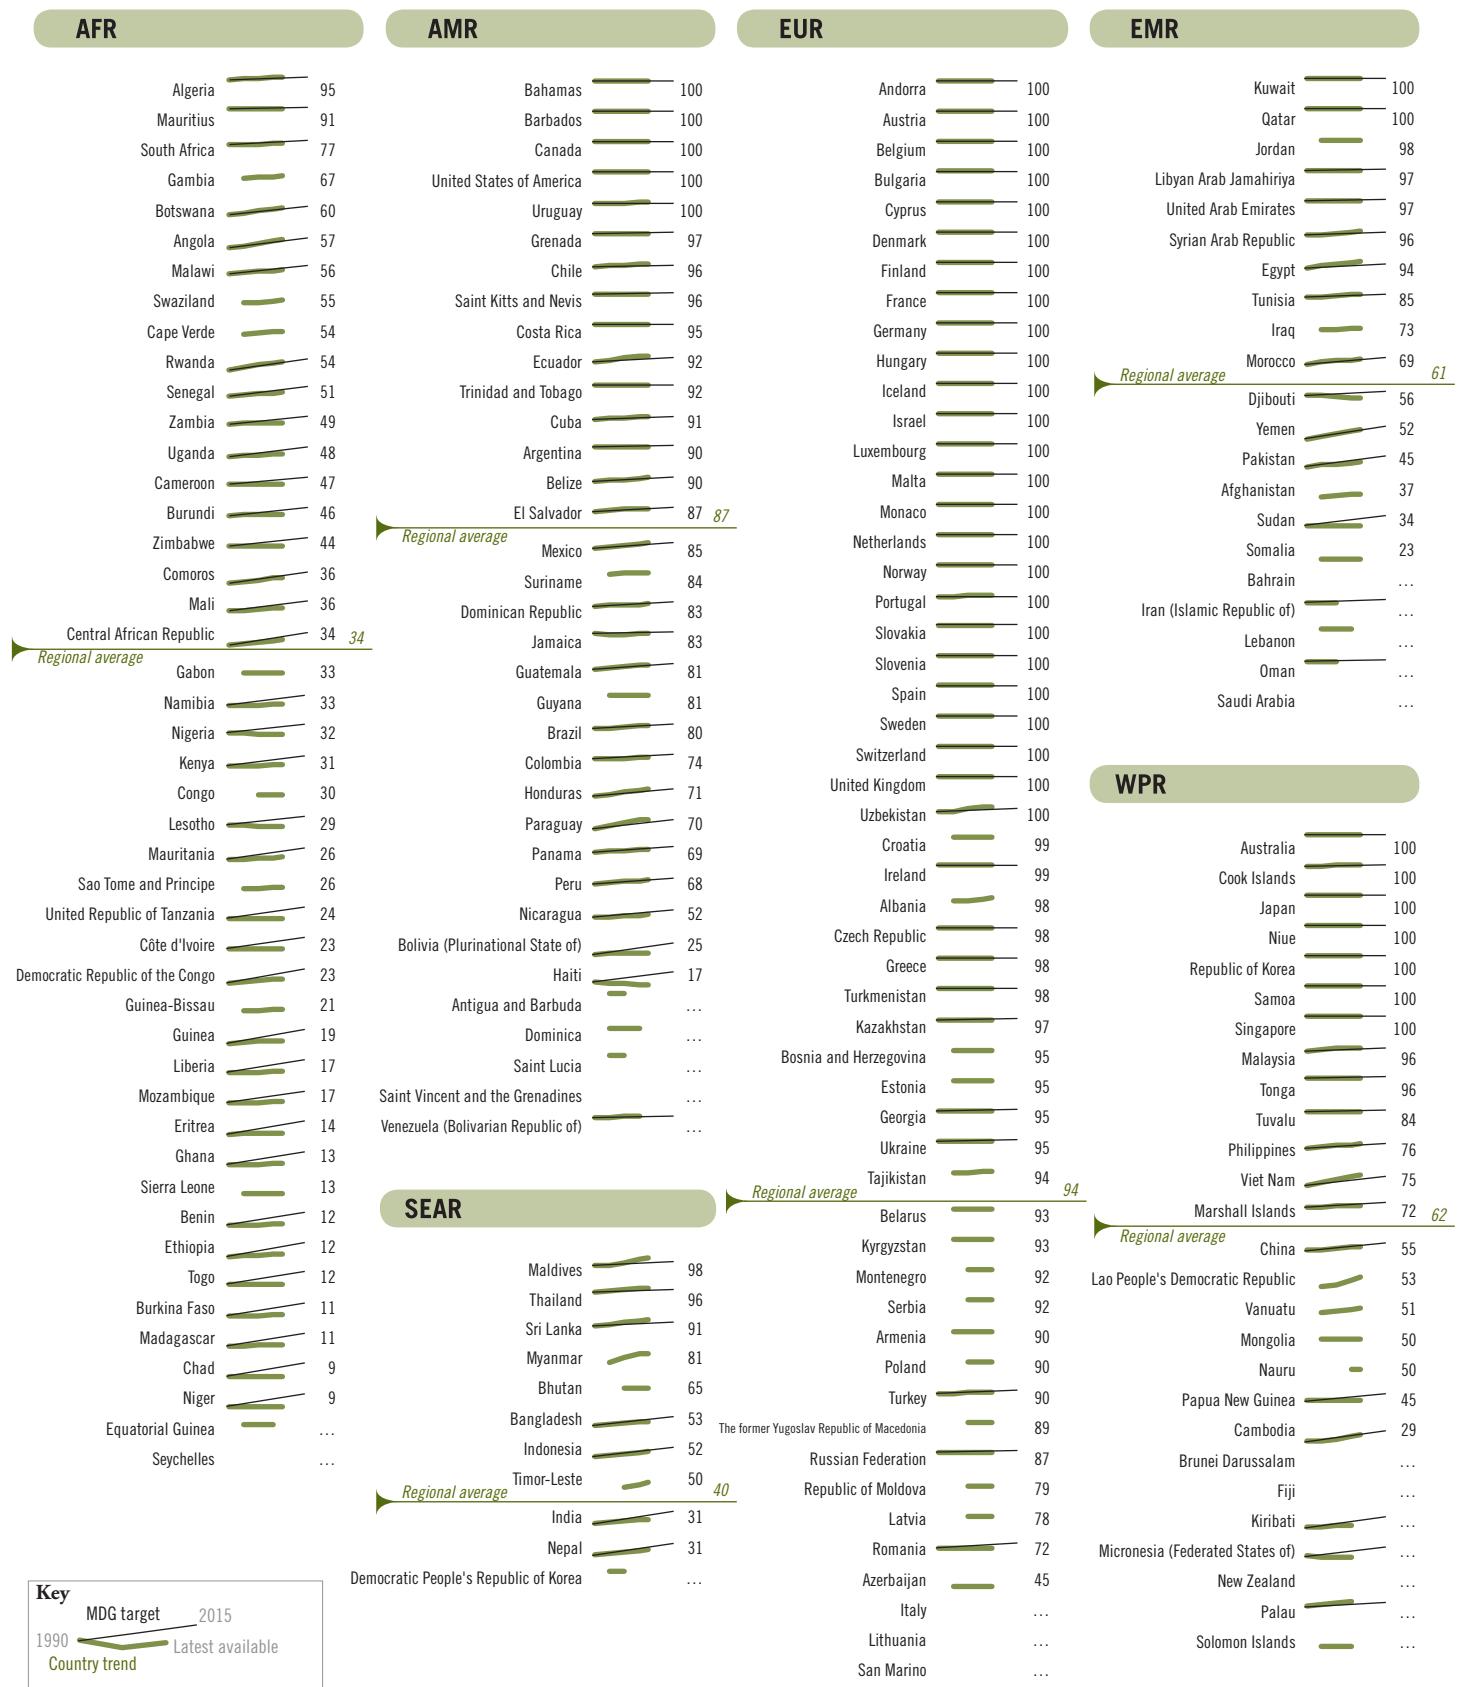

This chart shows the percentage of the population using an improved drinking-water source, with countries within each WHO region sorted by 2008 level. The bold lines indicate trends since 1990 or since the first year for which data are available.

The thin lines indicate the projected trend needed to double the proportion of people with sustainable access to safe drinking-water by 2015.

The MDG target is worded in terms of halving the proportion of people without sustainable access to safe drinking-water by 2015.

Further details can be found in Part II, Table 5.

## 19. Population using improved sanitation (%)

This chart shows the percentage of the population using an improved sanitation facility, with countries within each WHO region sorted by 2008 level. The bold lines indicate trends since 1990 or since the first year for which data are available.

The bold lines indicate trends since 1990 or since the first year for which data are available. The thin lines indicate the projected trend needed to double the proportion of people with sustainable access to basic sanitation by 2015.

The thin lines indicate the projected trend needed to double the proportion of people with sustainable access to basic sanitation by 2015. The MDC target is worded in terms of halving the proportion of people without sustainable access to basic sanitation by 2015.

The MDG target is worded in terms of halving the proportion of people without sustainable access to basic sanitation by 2015.

Further details can be found in Part II, Table 5.

## Part II

# Global Health Indicators

## Mortality and burden of disease

This section deals with indicators of life expectancy and mortality rates, which provide good summary measures of overall population health. The indicators include overall life expectancy at birth, as well as infant and under-five mortality (the probability of dying between birth and 1 and 5 years of age, respectively), and adult mortality (the probability of dying between 15 and 60 years of age). Levels and trends for child mortality (Figure 8 and Box 1) are particularly relevant in understanding public health because globally almost 20% of all deaths are of children less than 5 years old. Neonatal mortality (death during the first 28 days of life per 1000 live births) accounts for a large proportion of child deaths in many countries, especially in low-income settings.

Although estimates of life expectancy reflect how many years a person might be expected to live given the current mortality rates in specific settings, they say nothing about health status during life. Mortality statistics alone are insufficient in fully describing and comparing the health status of different populations because they underestimate the burden of ill-health caused by chronic conditions and provide no information on non-fatal health outcomes. “Healthy life expectancy” (HALE) at birth, on the other hand, represents the average number of years that a person could expect to live in “good health” by taking into account years lived in less than full health due to disease and/or injury. As a result, it captures both fatal and non-fatal health outcomes and disabilities, of which the most common worldwide are hearing loss, visual impairment and mental disorders.

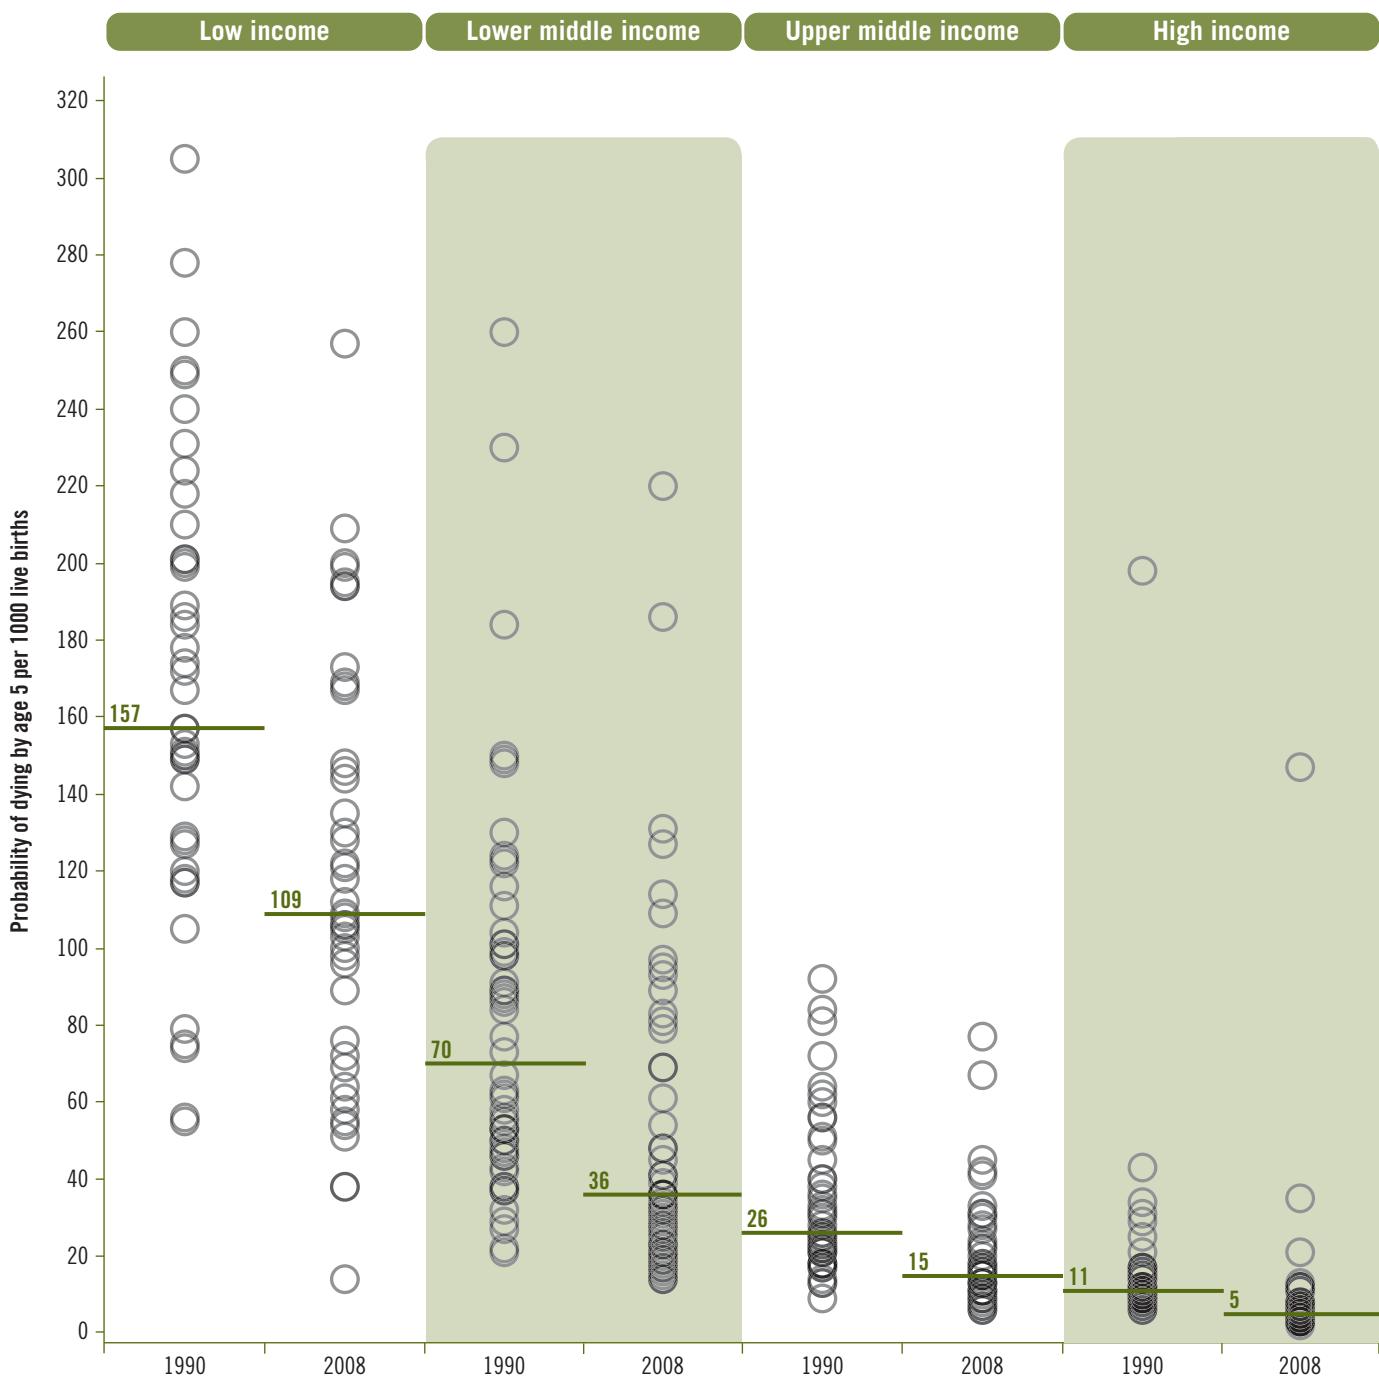

The estimates of mortality presented here have been derived wherever possible from death-registration data reported annually to WHO. For countries where such data are not available or are of poor quality, household surveys and censuses are used to create life tables from a model developed by WHO that generates estimates of mortality rates and life expectancy. In the case of child mortality, WHO is part of the Inter-agency Group for Child Mortality Estimation (IGME) which was established to advance the work on monitoring the progress made towards the achievement of the MDG target,<sup>18</sup> and works to harmonize the estimates used by its members. In addition, to develop its country estimates of HALE, WHO has conducted analyses of 135 causes of disability for 17 regions of the world and analysed 69 health surveys in 60 countries.

WHO makes every effort to standardize the methods used to estimate and project indicators for all Member States using comparable data. This may lead to some differences compared with the official statistics prepared by individual Member States. It is also important to stress that these estimates are subject to considerable uncertainty, especially for countries with weak statistical and health information systems where the quality of underlying empirical data is limited. Estimates of HALE are more uncertain than estimates of life expectancy, as it is particularly difficult to ensure comparable measurements of disability across countries, and to correct for limitations in the data. In recognition of this, uncertainty intervals for WHO estimates of mortality and life expectancy will be made available in the Global Health Observatory.

<sup>18</sup> MDG 4; Target 4.A: Reduce by two thirds, between 1990 and 2015, the under-five mortality rate.

Figure 8: Mortality rate in children under 5 years old by country-income group – 1990 and 2008

Note: Solid horizontal lines indicate the median.

**Box 1: Trends in child mortality**

In Figure 8, each circle represents a country (note that circles may overlap). From the data presented, three major conclusions emerge:

In general, wealthier countries have far lower levels of child mortality than poorer ones – in low-income countries, the median level of child mortality in 2008 was 109 deaths per 1000 live births, compared with 5 per 1000 in high-income countries, representing a more than 20-fold difference.

Several low-income countries have achieved comparably low levels of child mortality – with wide variation in levels of child mortality observed in most of the country-income groups. In low-income countries, child mortality in 2008 ranged from 14 to 257 per 1000 live births representing an 18-fold difference.

Child mortality rates have fallen since 1990 in all country-income groups – with the rate of decline generally faster in high-income and middle-income countries than in low-income countries. Median child mortality fell by almost 50% between 1990 and 2008 in lower middle-income countries, but by only 31% in low-income countries.

## Cause-specific mortality and morbidity

This section brings together indicators on the level and distribution of specific causes of deaths grouped as follows: communicable, maternal and perinatal conditions and nutritional deficiencies; noncommunicable conditions; and injuries.

Estimates are also provided of the distribution of causes of death among children under 5 years old. These include major communicable diseases such as HIV/AIDS, diarrhoea, malaria, measles and pneumonia, as well as conditions arising in the neonatal period such as prematurity, birth asphyxia, neonatal sepsis and congenital anomalies.

The “years of life lost” (YLL) is a measure of premature mortality that takes into account both the frequency of deaths and the age at which death occurs. The distribution of YLL by broad cause differs significantly by country-income group (Figure 9 and Box 2).

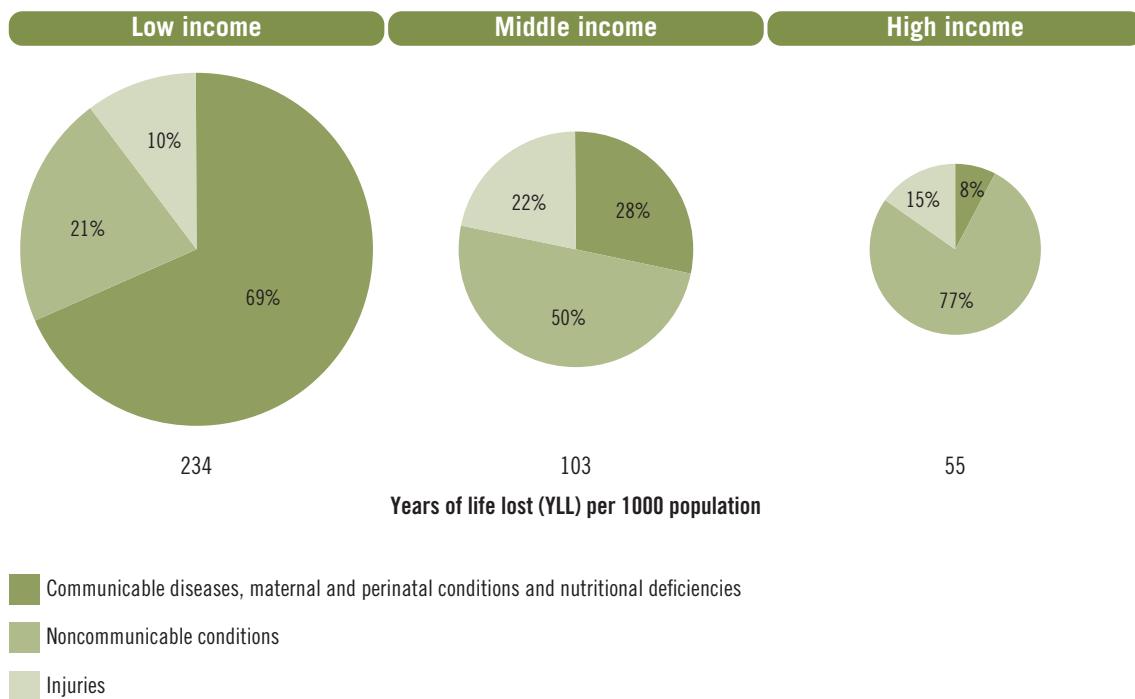

The country-specific indicators presented in this section have been derived from a range of data sources on mortality, incidence and prevalence data. These include death-registration records; health-facility reports; household surveys; censuses; and special studies on deaths due to HIV and conflict. There are considerable uncertainty ranges for many countries due to limitations in data availability, quality and timeliness. Uncertainty in estimated all-cause mortality for 2008 ranges from  $\pm 1\%$  for high-income countries to  $\pm 15\text{--}20\%$  for sub-Saharan Africa, reflecting a large difference in data availability. Uncertainty ranges are generally larger for deaths from specific causes. For example, the relative uncertainty for deaths from ischaemic heart disease ranges from around  $\pm 12\%$  for high-income countries to  $\pm 25\text{--}35\%$  for sub-Saharan Africa.

The section also includes estimates for key MDG-related indicators, including mortality due to maternal conditions, HIV/AIDS, tuberculosis and malaria. Estimating cause-specific mortality is difficult in developing countries where systems for counting deaths and accurately recording cause-of-death are weak or non-existent. These indicators are, therefore, associated with significant uncertainty – in the case of tuberculosis indicators the margins of uncertainty are provided.

Estimating maternal mortality is also particularly challenging because few developing countries have robust sources of data. Reported figures are derived from different sources and are of variable quality in terms of completeness, timeliness, reliability and accuracy. WHO and its partners are working to develop revised estimates that will be available during the second half of 2010. In the meantime, country-reported figures and 2005 interagency estimates are provided, along with the estimated margins of uncertainty.

Estimates of both disease incidence and prevalence are provided for tuberculosis and HIV/AIDS. Incidence is the number of new cases each year, while prevalence is the number of people with the disease at a specific point in time. Because not all people with infection attend health facilities, household surveys are required to obtain the true number of cases. Such surveys, however, only provide reliable data if the condition is sufficiently common. Tuberculosis surveys require very large sample sizes and are rarely conducted. Therefore, estimates for many countries depend upon modelling which relies heavily on the notification rate for tuberculosis; as a result the uncertainty range associated with both its incidence and prevalence is large. In countries with generalized HIV/AIDS epidemics, prevalence estimates are derived from the testing of pregnant women attending antenatal clinics and, more recently, from population-based surveys which include HIV testing. In concentrated HIV/AIDS epidemics, estimates are largely based upon surveillance among populations with high-risk behaviours.

Figure 9: Years of life lost (YLL) due to premature mortality by broad cause and country-income group – 2004<sup>19</sup>

<sup>19</sup> Income categories for 2004 shown in Figure 9 are as defined by the World Bank's *World development report 2004: Making services work for poor people*. Washington, DC, World Bank and Oxford University Press, 2003.

**Box 2: Years of life lost (YLL)**

YLL take into account the age at which deaths occur by assigning greater statistical weight to deaths occurring at younger ages and lower statistical weight to deaths occurring at older ages. In Figure 9, the YLL due to each major group of causes are shown as a proportion of the total YLL lost due to all premature mortality in the population. Each income-level chart is proportional in size in terms of the absolute number of YLL per 1000 population. Three major conclusions emerge from the data:

Low-income countries have the highest rates of premature mortality relative to their populations – total YLL per 1000 population are more than four times higher in low-income countries compared with high-income countries, and more than double the figure in middle-income countries.

The distribution of YLL by cause differs significantly by country-income group – in low-income countries, over two thirds of YLL per 1000 population are due to communicable diseases, maternal and perinatal conditions, and nutritional deficiencies. By contrast, these causes account for around one quarter of YLL per 1000 population in middle-income countries, and under 10% in high-income countries.

In high-income and middle-income countries, noncommunicable conditions are the major contributors to YLL – these conditions account for over three quarters of YLL per 1000 population in the former and half the total in the latter. In low-income countries, noncommunicable conditions account for a smaller percentage (21%) of total YLL per 1000 population. Nonetheless, in absolute terms, YLL due to noncommunicable diseases are higher in low-income countries than high-income ones.

## Selected infectious diseases

This section has been compiled from official national reports of case numbers for selected infectious diseases. Decisions on which diseases to include were made primarily on the basis of data availability. Where possible, a distinction is made between zero cases reported and no information available for a country. In isolation, the numbers given provide no indication of the relative risk of disease, nor of the quality of disease reporting in different countries. However, the section does give an indication of the current status of officially reported infectious disease data at the global level, and of the major reporting gaps. Given the variations in the methods countries use to obtain these numbers, no attempt has been made to calculate incidence or prevalence.

To interpret these numbers, both epidemiological patterns and data-collection efforts in specific countries must be considered. Some diseases (for example, malaria and yellow fever) are endemic to certain geographical regions, but are extremely rare elsewhere. Diseases such as plague are prone to outbreaks that can cause case numbers to fluctuate wildly over time. Some diseases are best tackled with preventive measures such as mass drug treatment, so reporting the number of cases is a lower priority than estimating the population at risk. For vaccine-preventable diseases, case numbers are affected by immunization rates. Diseases such as H5N1 influenza, Japanese encephalitis and malaria are difficult to identify without specialized laboratory tests that are often not available in developing countries. In many settings, cases of some diseases (such as malaria) are identified through clinical signs and symptoms alone.

Despite ongoing efforts to enhance disease surveillance and response, many countries face challenges in accurately identifying, diagnosing and reporting infectious diseases due to the remoteness of communities, lack of transport and communication infrastructures, and shortage of skilled health-care workers and laboratory facilities to ensure accurate diagnosis. No inference can be drawn from the figures shown about the efforts or progress that countries are making in controlling particular diseases.

Case numbers are also a poor indication of the burden of disease. Diseases such as H5N1 influenza and plague have high mortality rates, while diseases such as polio and leprosy have low mortality rates but result in a heavy loss of healthy years of life. Some diseases with very small initial case numbers can potentially cause devastating epidemics, and so mandatory reporting is essential. For diseases that are considered eradicable (such as leprosy and poliomyelitis) case reporting is essential to ensure that eradication efforts are targeted to the affected areas.

Some diseases are reported under the International Health Regulations, while others are monitored by countries or by WHO in the context of specific control programmes. Further information on disease incidence and prevalence, as well as on immunization coverage rates for vaccine-preventable diseases, can be obtained from the relevant WHO programme.

## Health service coverage

Health service coverage indicators reflect the extent to which people in need actually receive important health interventions. Such interventions include the provision of skilled care to women during pregnancy and childbirth; reproductive-health services; immunization to prevent common childhood infections; vitamin A supplementation in children; and the treatment of disease in children, adolescents and adults.

This section therefore presents data on the following MDG indicators: antenatal care coverage; births attended by skilled health personnel; measles immunization coverage among 1-year-olds; children aged <5 years sleeping under insecticide-treated nets; children aged <5 years with fever who received treatment with any antimalarial; unmet need for family planning; contraceptive prevalence; antiretroviral therapy coverage among people with advanced HIV infection; smear-positive tuberculosis case-detection rate; and smear-positive tuberculosis treatment-success rate.

Data are also presented on births by caesarean section; neonates protected at birth against neonatal tetanus; 1-year-olds immunized against diphtheria, tetanus and pertussis (DTP3), hepatitis B (HepB3), and *Haemophilus influenzae* type B (Hib3); vitamin A supplementation in children; children aged <5 years with acute respiratory infection (ARI) symptoms taken to a health facility; children aged <5 with diarrhoea receiving oral rehydration therapy (ORT); and HIV-infected pregnant women receiving antiretroviral therapy for the prevention of mother-to-child transmission (PMTCT) of HIV.

Coverage indicators are typically calculated by dividing the number of people receiving a defined intervention by the population eligible for – or in need of – the intervention. For example, immunization coverage among 1-year-old children can be calculated from the number of children having received a specific vaccine divided by the total population of children aged one in each country (Figure 10 and Box 3). For indicators on antenatal care, births attended by skilled health personnel and births by caesarean section, the denominator is the total number of live births in the defined population.

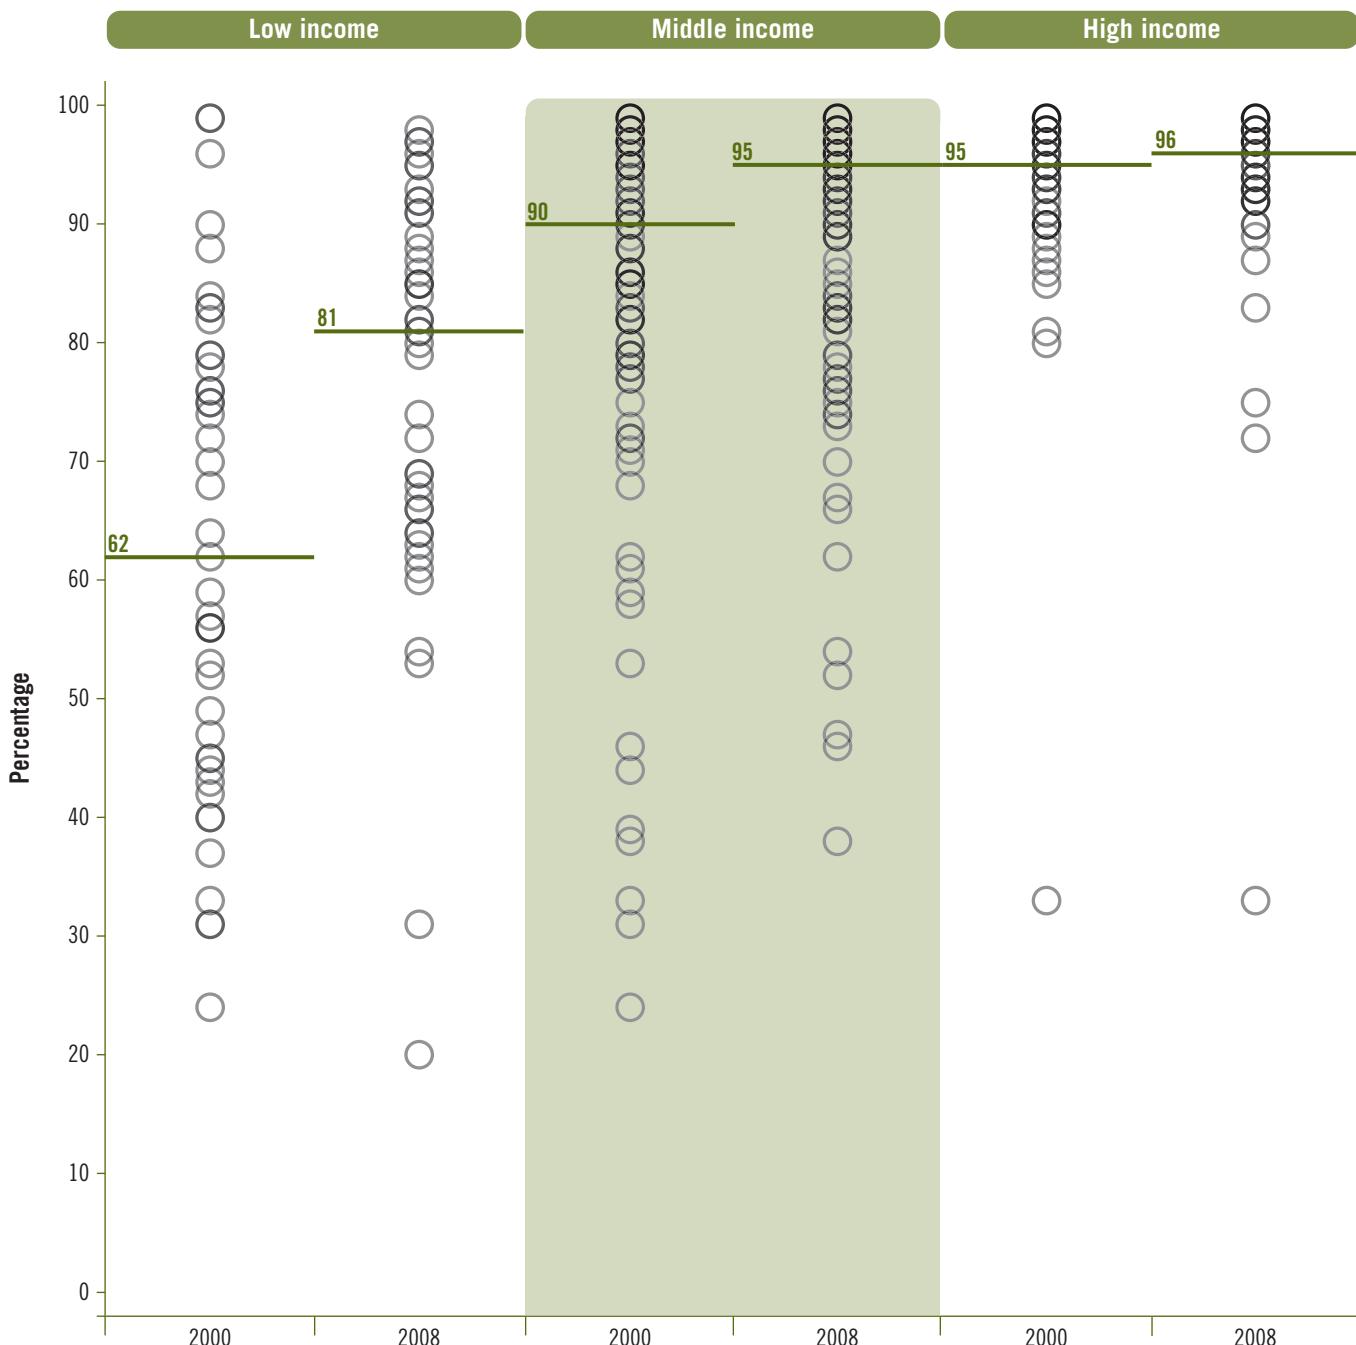

The main sources of data on health service coverage are household surveys and completed questionnaires on health service use. The principal types of surveys used are the UNICEF Multiple Indicator Cluster Survey (MICS), the Demographic and Health Survey (DHS) and country health and economic surveys. Another source of data is the administrative records of routine service provision, which provide data on the numerator. The denominator is estimated on the basis of census projections.

It should be borne in mind that administrative records tend to overestimate coverage as a result of double counting in the numerator and uncertainty in the denominator. Although household surveys are generally considered to be more reliable, these are subject to respondent reporting errors as well as to margins of uncertainty due to sampling errors. In generating global estimates, it is good practice to reconcile data from multiple sources in order to maximize the accuracy of all estimates.

Unavoidable differences in terminology also occur from country to country making standardization difficult. For example, there are significant variations across countries in the precise skills and training of health workers grouped as “skilled birth attendants”. Indicator definitions may also change over time. As a result of these and other issues, there may be limitations on the comparability of results across countries and over time.

Regional aggregates are not available for several coverage indicators, reflecting both the limited availability of data for several indicators, and the fact that some conditions (such as malaria) are not of public health significance in all countries.

Figure 10: Immunization (DTP3) coverage among 1-year-olds by country-income group – 2000 and 2008

Note: Solid horizontal lines indicate the median.

**Box 3: Trends in immunization coverage**

In Figure 10, each circle represents a country (note that circles may overlap). From the data presented, three major conclusions emerge:

Low-income countries demonstrated substantial increases in DPT3 immunization coverage between 2000 and 2008 – median immunization coverage rose from 62% to 81% over the 8-year period and by 2008, one quarter of all low-income countries had achieved coverage levels of 91% or higher.

Despite these gains, immunization coverage in low-income countries remains significantly below the levels in middle-income and high-income countries – in 2008, median coverage was 95% and 96% respectively in such countries, compared with 81% in low-income countries.

There are wide variations in immunization coverage levels within the middle-income and low-income country groups – with levels in 2008 ranging from as low as 20% up to 99% (representing a five-fold difference). Improvements in the level of immunization coverage must continue to be achieved in a number of countries if such wide variations are to be reduced and median levels of coverage increased.

Table 4

## Risk factors

This section presents indicators for certain risk factors that are associated with increased mortality and morbidity. The preventable risks presented here are: unsafe water and lack of sanitation; use of solid fuels in households; low birth weight; poor infant feeding practices; childhood under-nutrition; being overweight or obese; harmful consumption of alcohol; use of tobacco; and unsafe sex.

Low birth weight is an important predictor of the health and survival of the newborn but in many settings (especially where deliveries occur outside health-care facilities) many infants are not weighed at birth.

Child growth is the most widely used indicator of nutritional status. Included in the estimates presented in this section are the three indicators: “stunted”; “underweight” (which is an MDG indicator); and “overweight”. Stunting (i.e. low height-for-age) reflects the cumulative effects of under-nutrition and infections since birth – and even before birth. Evidence of this condition indicates chronic malnutrition, which is likely to have the most serious and long-lasting impact on health. Being underweight may reflect wasting (i.e. low weight-for-height) which indicates acute weight loss and/or stunting. Thus, it is a composite indicator that is more difficult to interpret. Fewer data are available on the levels of overweight children, although there is increasing evidence in many countries of a double burden of malnutrition (with high levels of underweight or stunting) in some population groups coupled with high levels of overweight in other groups.

The prevalence of current tobacco smoking is an important predictor of the future burden of tobacco-related diseases. Harmful use of alcohol can cause alcohol dependence, hepatic cirrhosis, cancer and injuries.

The use of solid fuels in households is a proxy for indoor air pollution. Using solid fuels such as wood, charcoal and crops is associated with increased mortality from pneumonia and other acute lower respiratory diseases among children as well as increased mortality from chronic obstructive pulmonary disease and lung cancer (where coal is used) among adults.

Unsafe water supplies and inadequate levels of sanitation and hygiene increase the transmission of diarrhoeal diseases (including cholera); schistosomiasis; trachoma; and hepatitis. Although more people globally now are using “improved” drinking-water sources<sup>20</sup> and “improved” sanitation facilities<sup>21</sup> compared to 2000, the rate of improvement will need to accelerate to meet the relevant MDG target<sup>22</sup> for 2015 (Figure 11 and Box 4).

Data on risk factors and health-related behaviours are generally drawn from household surveys. It is important to note that the reliability of these estimates depends on the overall quality of the sampling frames and methods used; on interviewer training, data-quality assurance procedures, and statistical analyses of the data; and on the ability and willingness of respondents to provide accurate responses. Where data from household surveys are not available, statistical techniques may be used to develop estimates in some settings.

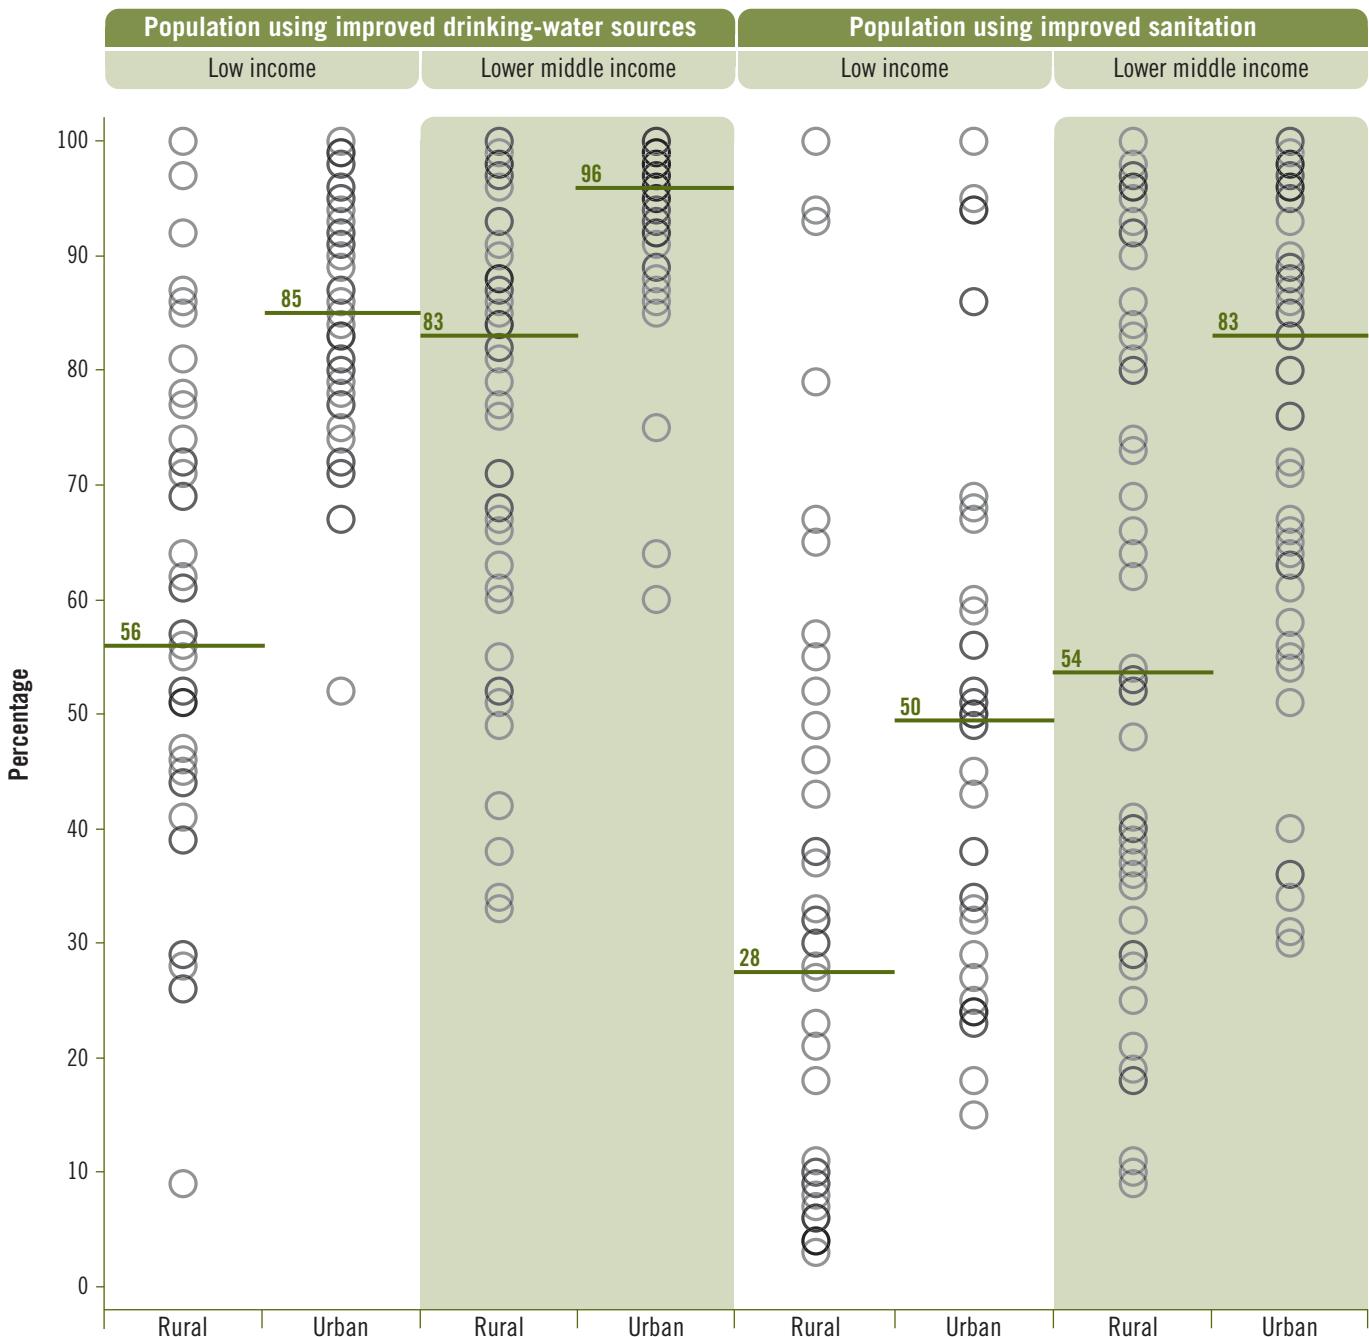

<sup>20</sup> Improved drinking-water sources include: piped water into dwelling, plot or yard; public tap/standpipe; borehole/tube well; protected dug well; protected spring; rainwater collection; and bottled water (if a secondary available source is also improved).

<sup>21</sup> Improved sanitation facilities are facilities that hygienically separate human excreta from human contact and include: flush/pour flush toilets or latrines connected to a sewer, septic tank or pit; ventilated pit latrines; pit latrines with a slab or platform of any material which covers the pit entirely except for the drop hole; and composting toilets/latrines.

<sup>22</sup> MDG 7; Target 7.C: Halve, by 2015, the proportion of people without sustainable access to safe drinking-water and basic sanitation.

Use of an improved drinking-water source is a proxy for access to safe drinking-water. Similarly, the indicator used as a proxy for access to basic sanitation records the proportion of the population using an improved sanitation facility. Definitions and a detailed description of drinking-water sources and sanitation facilities can be found at the web site of the WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation at [www.wssinfo.org](http://www.wssinfo.org)

**Figure 11: Population using improved drinking-water sources and sanitation in low-income and lower middle-income countries by rural and urban areas – 2008**

Note: Solid horizontal lines indicate the median.

**Box 4: Use of improved drinking-water sources and sanitation**

In Figure 11, each circle represents a country (note that circles may overlap). From the data presented, three major conclusions emerge:

The use of improved drinking-water and sanitation are heavily dependent upon country income and place of residence – people living in rural areas in low-income countries are least likely to have access to improved drinking-water and sanitation facilities.

The use of improved sanitation is generally far lower than the use of improved drinking-water in both rural and urban areas – in low-income countries, median use of improved drinking-water in rural areas is 56% compared with only 28% for sanitation. In the corresponding urban areas, the figures are 85% and 50% respectively.

There are wide inequalities across countries in the use of both improved drinking-water and sanitation facilities – for example in rural areas of lower middle-income countries, improved sanitation levels ranged from 9% to 100% – representing an 11-fold difference.

Table 5

## Health workforce, infrastructure and essential medicines

This section presents data on the resources available to the health system – this includes physicians; nurses and midwives; other health-care workers; and hospital beds. The table also includes the MDG target<sup>23</sup> indicator on access to essential medicines. Such data are essential in enabling governments to determine how best to meet the health-related needs of their populations.

Estimates of the numbers and density of the health workforce (Figure 12 and Box 5) refer to the active health workforce – i.e. those currently participating in the health labour market. The data are derived from multiple sources, including national population censuses; labour-force and employment surveys; health-facility assessments; and routine administrative information systems.<sup>24</sup>

This diversity of sources means there is considerable variability in the coverage and quality of the data. Figures may be under-estimated or over-estimated where it is not possible to distinguish whether they include health workers in the private sector, or to identify the double counting of health workers holding two or more jobs at different locations. In addition health service providers may be working outside the health-care sector, working in unpaid and/or unregulated conditions, or not currently engaged in the national health labour market.

The density of hospital beds can be used to indicate the availability of inpatient services. Statistics on hospital-bed density are generally drawn from routine administrative records but in some settings only public-sector beds are included.

Data on the availability of medicines are poor in most developing countries. However, data on availability and consumer prices for selected generic medicines have been derived from surveys of medicine prices and availability conducted using WHO/Health Action International (HAI) standard methods between 2001 and 2008. In individual surveys, availability is reported as the percentage of medicine outlets in which a medicine was found on the day of data collection. As baskets of medicines differ by country, results are not strictly comparable across countries. The consumer price ratio is an expression of how much greater or less the local medicine price is than the international reference price.

<sup>23</sup> MDG 8; Target 8.E: In cooperation with pharmaceutical companies, provide access to affordable essential drugs in developing countries.

<sup>24</sup> These include registries on public expenditure, staffing and payroll, as well as records of professional training, registration and licensure.

Figure 12: Global distribution of the health workforce (per 10 000 population) 2000–2009

**Box 5: Health workforce distribution**

Figure 12 illustrates the density of physicians and nursing and midwifery personnel as the number of physicians and nurses/midwives per 10 000 population. From the data presented, three major conclusions emerge:

In general, countries with the lowest density for both physicians and nurses/midwives are in the WHO African Region.

European countries have the highest physician densities.

The highest nurse/midwife densities are found in the more-developed regions of the world.

## Health expenditure

This section presents data on government, private, external, social security and out-of-pocket expenditures on health. These data are generated from information collected by WHO for over 10 years. The most comprehensive and consistent data on health financing are generated from national health accounts (NHAs) that collect expenditure information within an internationally recognized framework. NHAs trace financing as it flows from funding sources, to decision-makers who decide upon the use of the funds, to the providers and beneficiaries of health services. Not all countries maintain or update NHAs – in such cases data are obtained through technical contacts in the country or from publicly available documents and reports. Missing values are estimated using various accounting techniques depending on the data available for each country. WHO sends all such estimates to the respective ministries of health every year for validation. As a general rule, life expectancy rises with increasing per capita total health expenditure; however, there are diminishing returns (Figure 13 and Box 6).

**Figure 13: Life expectancy at birth against per capita total health expenditure**

**Box 6: Life expectancy and per capita total health expenditure**

In Figure 13, each shape represents one country coded according to WHO region. Three major conclusions can be drawn from the data:

As a general rule, life expectancy rises with increasing per capita total health expenditure; however, there are diminishing returns – the highest levels of per capita health expenditure are associated with only modest or no improvements in life expectancy. In addition, a number of countries have achieved high levels of life expectancy despite relatively lower per capita health expenditures.

In almost one quarter of countries, health expenditure in 2007 was less than 100 PPP int. \$ per capita – most of these countries are in the WHO African Region and three quarters of them had a life expectancy at birth of 60 years or lower in 2008.

Countries with the highest levels of per capita health expenditure are mainly those in the WHO Region of the Americas and the WHO European Region.

## Health inequities

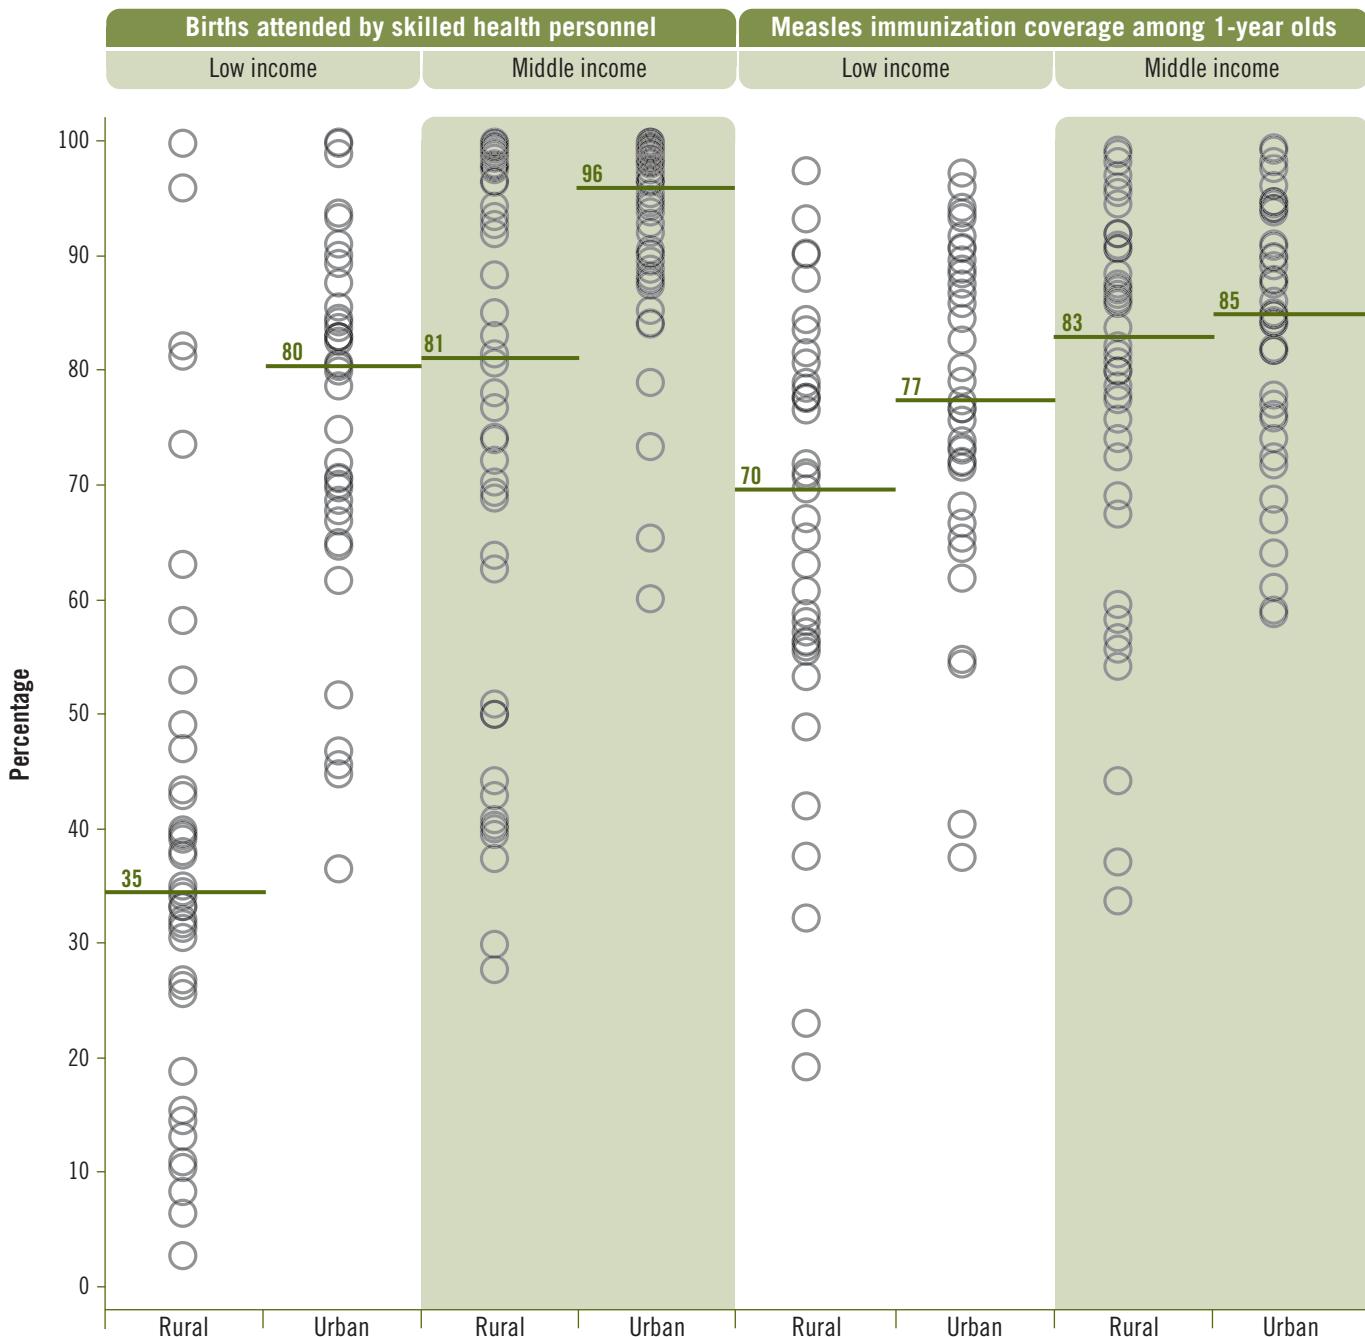

In general, the global reporting of health indicators focuses on national averages. However, data on the distribution of health and health services within countries and between population subgroups are equally important (Figure 14 and Box 7). Such data help to identify health inequities – unfair and avoidable differences in health and health service provision – that arise for example from socioeconomic factors (such as level of education, occupation and household wealth or income), from geographical location, and from ethnicity and gender.

This section presents data from 87 countries using three health indicators – percentage of births attended by skilled health personnel, measles immunization coverage among 1-year-old children, and mortality in children under 5 years old (under-five mortality) – disaggregated according to urban or rural residence, household wealth and maternal educational level.

The main sources of the data are the Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS), conducted between 2000 and 2008. For the disaggregations by household wealth, the total population is classified into wealth quintiles based on relative differences in household wealth within the country rather than an absolute wealth criterion. The estimates are subject to normal sample variability, which are usually indicated by confidence intervals – however, only the point estimates are shown in this section.

The data presented refer to ratios and differences between the most-advantaged and least-advantaged groups. However, these measures do not reflect the situation across all population groups (such as groups falling into the middle of wealth or education distributions) for which other measures are used.

**Figure 14: Urban–rural differences in the coverage of skilled attendant at birth and measles immunization in low-income and middle-income countries – 2000–2008**

Note: Solid horizontal lines indicate the median.

**Box 7: Inequities in health service coverage**

In Figure 14, each circle represents a country (note that circles may overlap). Three major conclusions can be drawn from the data:

There are differences between rural and urban areas in coverage of key health services such as skilled attendant at birth and measles immunization – these differences are more marked in low-income countries compared with middle-income countries, and significantly more acute in relation to skilled attendant at birth than to measles immunization.

In low-income countries, there are major differences between urban and rural areas in the coverage of skilled attendant at birth – 80% of urban births take place with the assistance of skilled health personnel compared with only 35% of births in rural areas. By contrast, urban–rural differences with regard to measles immunization rates are less pronounced at 77% and 70%, respectively.

Within the low-income country group, there is very wide variation in both indicators – for example, coverage of skilled attendant at birth in rural areas ranges from as low as 3% to as high as 100%.

## Demographic and socioeconomic statistics

This section presents data on demographic and socioeconomic factors that are major determinants of health. For example, reductions in child mortality are closely associated with improvements in female education (Figure 15, Box 8). The table includes three MDG-related indicators – adolescent fertility; primary school enrolment ratios; and population living in poverty. The table also includes data on demographics (population size, growth, fertility rates and urbanization); coverage of civil registration of births and deaths; adult literacy; and per capita gross national income. In addition to their intrinsic value, such data are also important in making other statistics comparable across countries. For example, data on disease incidence, prevalence and mortality rates, and on the availability of health-system resources all require reliable population-based denominators.

These demographic and socioeconomic data have been derived from a variety of national and international sources. The latter include the World Bank, the United Nations Educational, Scientific and Cultural Organization (UNESCO), the United Nations Children's Fund (UNICEF) and the United Nations Department of Economic and Social Affairs (UNDESA). Estimates are based on a combination of administrative records, population-based surveys, censuses and civil registration data and on statistical modelling to account for missing values. For more information on the sources and methods used for a particular indicator, please refer to the relevant footnotes and to the web site of the responsible organization.

Figure 15: Mortality rate in children under 5 years old against female net primary school enrolment rate

**Box 8: Correlation between female primary education and child mortality rates**

In Figure 15, the available data from 120 countries is shown. Each shape represents one country coded according to WHO region. Two conclusions can be drawn from the data:

High rates of child mortality are strongly associated with a lack of female primary education – in general, countries with a higher rate of female primary education have lower levels of under-five mortality.

There is much more variation between countries in the WHO African Region than in other WHO regions – where there are few outliers.

These summary tables represent the best estimates of WHO – based on evidence available in 2009 – rather than the official estimates of Member States. These estimates have been computed using standard categories and methods to enhance cross-national comparability. Therefore, they are not always the same as official national estimates, nor necessarily endorsed by specific Member States.

For indicators with a reference period expressed as a range, figures refer to the latest available year in the range; except in **Table 8. Health inequities**, where the figures refer to the period specified. For more information on specific years, indicator definitions and metadata, please refer to [www.who.int/whosis](http://www.who.int/whosis).

... Data not available or not applicable.

The global, regional and income aggregates for rates and ratios are weighted averages when relevant, while for absolute numbers they are the sums. Aggregates are calculated only if data are available for 50% of the population within the group. Income-group aggregates are calculated using the 2009 World Bank list of economies<sup>1</sup> unless otherwise noted.

## Table 1 Mortality and burden of disease

<sup>a</sup> *Life tables for WHO Member States*. Geneva, World Health Organization, 2010 ([http://www.who.int/whosis/database/life\\_tables.cfm](http://www.who.int/whosis/database/life_tables.cfm)).

<sup>b</sup> Healthy life expectancy (HALE) estimates use methods described in the statistical annex to *The world health report 2004 – Changing history*. Estimates for 2007 have been revised to take into account the Global Burden of Disease estimates for Member States for the year 2004 and may not be entirely comparable with those for 2002 published in *World Health Statistics 2007*. Income-group aggregates are based on the 2008 World Bank list of economies.

<sup>c</sup> *Mortality data*. Geneva, World Health Organization, 2010 ([www.who.int/healthinfo/statistics/mortality/en/](http://www.who.int/healthinfo/statistics/mortality/en/)).

## Table 2 Cause-specific mortality and morbidity

<sup>a</sup> Sources: *Towards reaching health-related Millennium Development Goals: Progress report and way forward. Report of the regional director*. Brazzaville, WHO Regional Office for Africa, 2009. See Annex 3; *PAHO basic indicators 2009*. Washington, DC, Pan American Health Organization, 2009 ([www.paho.org/English/SHA/coredata/tabulator/newTabulator.htm](http://www.paho.org/English/SHA/coredata/tabulator/newTabulator.htm)); *European health for all database* (HFA-DB). Copenhagen, WHO Regional Office for Europe, 2009 (<http://data.euro.who.int/hfadb>); *Country health information profiles* (CHIPS). Manila, WHO Regional Office for the Western Pacific, 2009 ([www.wpro.who.int/countries/countries.htm](http://www.wpro.who.int/countries/countries.htm)); *Core health indicators and MDGs*. New Delhi, WHO Regional Office for South-East Asia, 2008 (<http://203.90.70.117/esidas/CoreHealthData.asp>). Additional data compiled by the WHO Regional Office for the Eastern Mediterranean.

<sup>b</sup> *Maternal mortality in 2005: estimates developed by WHO, UNICEF, UNFPA and the World Bank*. Geneva, World Health Organization, 2007 ([www.who.int/reproductive-health/publications/maternal\\_mortality\\_2005/mme\\_2005.pdf](http://www.who.int/reproductive-health/publications/maternal_mortality_2005/mme_2005.pdf)). Income-group aggregates are based on the 2005 World Bank list of economies.

<sup>c</sup> Based on the *2008 report on the global AIDS epidemic*. Geneva, UNAIDS and World Health Organization, 2008. See Annex: HIV and AIDS estimates and data, 2007 and 2001 ([http://data.unaids.org/pub/GlobalReport/2008/jc1510\\_2008\\_global\\_report\\_pp211\\_234\\_en.pdf](http://data.unaids.org/pub/GlobalReport/2008/jc1510_2008_global_report_pp211_234_en.pdf)). Ranges of estimates are available from this document. WHO regional and global figures are updates for the year 2008. Income-group aggregates are based on the 2008 World Bank list of economies.

<sup>d</sup> *World malaria report 2008*. Geneva, World Health Organization, 2008 ([www.who.int/malaria/wmr2008](http://www.who.int/malaria/wmr2008)). See Annex 1: Estimating the numbers of malaria cases and deaths by country in 2006.

<sup>e</sup> These are classified as deaths from tuberculosis (A15–A19, B90) according to the *International statistical classification of diseases and related health problems*, tenth revision. Geneva, World Health Organization, 1992. *Global tuberculosis control: A short update to the 2009 report*. Geneva, World Health Organization, 2009 (WHO/HTM/TB/2009.426) ([www.who.int/tb/publications/global\\_report](http://www.who.int/tb/publications/global_report)). WHO region, income group and global aggregates include territories.

<sup>1</sup> *World Bank list of economies (July 2009)*. Washington, DC, World Bank, July 2009: <http://siteresources.worldbank.org/DATSTATISTICS/Resources/CLASS.XLS>

<sup>f</sup> Mortality and burden of disease estimates for WHO Member States in 2004. Geneva, World Health Organization, 2009 ([www.who.int/entity/healthinfo/statistics/bodgbdeathdalystimates.xls](http://www.who.int/entity/healthinfo/statistics/bodgbdeathdalystimates.xls)). Communicable diseases include maternal causes, conditions arising during the perinatal period and nutritional deficiencies. Income-group aggregates are based on the 2004 World Bank list of economies.

<sup>g</sup> Rates are age-standardized to WHO's world standard population. Ahmad OB et al. *Age standardization of rates: a new WHO standard*. Geneva, World Health Organization, 2001 (GPE Discussion Paper Series No. 31) ([www.who.int/healthinfo/paper31.pdf](http://www.who.int/healthinfo/paper31.pdf)).

<sup>h</sup> Individual percentages may not add up to 100% due to rounding.

<sup>i</sup> Mortality data. Geneva, World Health Organization, 2010 ([www.who.int/healthinfo/statistics/mortality/en/](http://www.who.int/healthinfo/statistics/mortality/en/)).

<sup>j</sup> Data are for all forms of tuberculosis including tuberculosis in people with HIV infection. *Global tuberculosis control: A short update to the 2009 report*. Geneva, World Health Organization, 2009 (WHO/HTM/TB/2009.426) ([www.who.int/tb/publications/global\\_report](http://www.who.int/tb/publications/global_report)). WHO region, income group and global aggregates include territories.

<sup>k</sup> The number of deaths is estimated at less than 0.05 per 100 000 population.

<sup>l</sup> The Ministry of Health and Social Services Seychelles reported 1 maternal death in 2008.

### Table 3 Selected infectious diseases

<sup>a</sup> Cholera: global surveillance summary, 2008. *Weekly Epidemiological Record*, No. 31, 2009, 84:309–324 ([www.who.int/wer](http://www.who.int/wer)).

<sup>b</sup> WHO/UNICEF estimates of disease incidence. Geneva, World Health Organization, 2009 ([www.who.int/immunization\\_monitoring/data/en/](http://www.who.int/immunization_monitoring/data/en/)).

<sup>c</sup> Cumulative number of confirmed human cases of avian influenza A/(H5N1) reported to WHO. Geneva, World Health Organization, 2009 ([www.who.int/csr/disease/avian\\_influenza/country/cases\\_table\\_2009\\_12\\_30/en/index.html](http://www.who.int/csr/disease/avian_influenza/country/cases_table_2009_12_30/en/index.html)). All dates refer to onset of illness. WHO reports only laboratory-confirmed cases.

<sup>d</sup> Global leprosy situation, 2009. *Weekly Epidemiological Record*, No. 33, 2009, 84:333–340 ([www.who.int/wer](http://www.who.int/wer)).

<sup>e</sup> World malaria report 2009. Annex 3.A: Reported malaria cases, 1990–2008. Geneva, World Health Organization, 2009 ([www.who.int/malaria/world\\_malaria\\_report\\_2009/en/index.html](http://www.who.int/malaria/world_malaria_report_2009/en/index.html)).

<sup>f</sup> Suspected meningitis cases reported to WHO Epidemic and Pandemic Alert and Response (EPR) in African countries under enhanced surveillance up to 29 November 2009.

<sup>g</sup> Human plague: review of regional morbidity and mortality, 2004–2009. *Weekly Epidemiological Record*, No. 6, 2010, 85:37–48 ([www.who.int/wer](http://www.who.int/wer)).

<sup>h</sup> Data from World Health Organization, Polio Eradication Initiative, as of 12 January 2010. Updated information can be found at: [www.who.int/immunization\\_monitoring/en/diseases/polio/myelitis/case\\_count.cfm](http://www.who.int/immunization_monitoring/en/diseases/polio/myelitis/case_count.cfm) Confirmed polio cases refer to any circulating polioviruses (wild poliovirus and circulating Vaccine Derived Poliovirus – cVDPV). Figures include 2 cVDPVs in the Democratic Republic of the Congo and India; 1 cVDPV in Ethiopia and Guinea; and 148 cVDPVs in Nigeria. Afghanistan, India, Nigeria and Pakistan are currently endemic countries. For non-endemic countries, cases are the result of importation.

<sup>i</sup> Number of new smear-positive cases notified to WHO. *Global tuberculosis control: A short update to the 2009 report*. Geneva, World Health Organization, 2009 (WHO/HTM/TB/2009.426) ([www.who.int/tb/publications/global\\_report](http://www.who.int/tb/publications/global_report)). WHO regional, income group and global figures exclude territories and may differ from those in the publication.

<sup>j</sup> Number of cases reported up to 05 July 2009.

<sup>k</sup> Number of cases reported up to 05 October 2009.

<sup>l</sup> Number of cases reported up to 26 July 2009.

<sup>m</sup> Number of cases reported up to 09 November 2009.

<sup>n</sup> Data represent only 15 northern states of Sudan.

YEN. 81.4 CL-3

**Table 4 Health service coverage**

- <sup>a</sup> UNICEF global database on maternal health. New York, UNICEF, 2010 ([www.childinfo.org/antenatal\\_care\\_country.php](http://www.childinfo.org/antenatal_care_country.php) – January 2010 update).
- <sup>b</sup> WHO global database on maternal health indicators, 2009 update. Geneva, World Health Organization, 2009 ([www.who.int/reproductive-health/global\\_monitoring/index.html](http://www.who.int/reproductive-health/global_monitoring/index.html)). In order to enhance comparability over time, the reported figures are derived, to the extent possible, from broadly comparable data sources. Therefore, reported figures may not refer to the most recently available data. Refer to the source for more complete information on time trends and metadata.
- <sup>c</sup> Proportion of neonates protected at birth against neonatal tetanus through maternal immunization with tetanus toxoid, based on a mathematical model taking into account the mother's immunization in infancy, during pregnancy and in tetanus campaigns. The model is described in: Griffiths UK et al. Incremental cost-effectiveness of supplementary immunization activities to prevent neonatal tetanus in Pakistan. *Bulletin of the World Health Organization*, 2004, 82:643–651. WHO/UNICEF estimates of national immunization coverage. Geneva, World Health Organization, 2009 ([www.who.int/immunization\\_monitoring/routine/immunization\\_coverage/en/index4.html](http://www.who.int/immunization_monitoring/routine/immunization_coverage/en/index4.html)).
- <sup>d</sup> Measles = measles-containing vaccine (MCV); DTP3 = 3 doses of diphtheria-tetanus-pertussis vaccine; HepB3 = 3 doses of hepatitis B vaccine; Hib3 = 3 doses of *Haemophilus influenzae* type B vaccine. WHO/UNICEF estimates of national immunization coverage. Geneva, World Health Organization, 2009 ([www.who.int/immunization\\_monitoring/routine/immunization\\_coverage/en/index4.html](http://www.who.int/immunization_monitoring/routine/immunization_coverage/en/index4.html)). Estimates based on data available up to December 2009. For countries recommending the first dose of measles vaccine in children older than 12 months of age, the indicator is calculated as the proportion of children less than 24 months of age receiving one dose of measles-containing vaccine. Complete coverage estimates are available online.
- <sup>e</sup> Data compiled by WHO from Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS) January 2010 ([www.measuredhs.com](http://www.measuredhs.com); and [www.unicef.org/statistics/index\\_24302.html](http://www.unicef.org/statistics/index_24302.html)).
- <sup>f</sup> World malaria report 2009. Geneva, World Health Organization, 2009 ([www.who.int/malaria/world\\_malaria\\_report\\_2009/en/index.html](http://www.who.int/malaria/world_malaria_report_2009/en/index.html)). See Annex 6.
- <sup>g</sup> World contraceptive use 2009. New York, Population Division, Department of Economic and Social Affairs, United Nations Secretariat, 2009 (POP/DB/CP/Rev2009).
- <sup>h</sup> PMTCT = prevention of mother-to-child transmission. Point estimates are published only for countries with a generalized epidemic. Regional and level-of-income aggregates are based on data for all low-income and middle-income countries when available. *Towards universal access: scaling up priority HIV/AIDS interventions in the health sector: progress report, September 2009*. Geneva, World Health Organization, Joint United Nations Programme on HIV/AIDS, United Nations Children's Fund, 2009. See Annexes 3 and 4.
- <sup>i</sup> *Towards universal access: scaling up priority HIV/AIDS interventions in the health sector: progress report, 2008*. Geneva, World Health Organization, Joint United Nations Programme on HIV/AIDS, United Nations Children's Fund, 2008. WHO regional and global figures are updates for the year 2008. Income-group aggregates are based on the World Bank 2008 list of economies.
- <sup>j</sup> The case-detection rate is the number of new smear-positive cases reported to WHO divided by the estimated number of new smear-positive cases. *Global tuberculosis control: a short update to the 2009 report*. Geneva, World Health Organization, 2009 (WHO/HTM/TB/2009.426) ([www.who.int/tb/publications/global\\_report](http://www.who.int/tb/publications/global_report)). WHO region, income group and global aggregates include territories.
- <sup>k</sup> The treatment-success rate is the percentage of new smear-positive patients registered for treatment who were cured (with laboratory confirmation) or who completed their course of treatment. *Global tuberculosis control: a short update to the 2009 report*. Geneva, World Health Organization, 2009 (WHO/HTM/TB/2009.426) ([www.who.int/tb/publications/global\\_report](http://www.who.int/tb/publications/global_report)). WHO region, income group and global aggregates include territories.
- <sup>l</sup> Composition of methods might be slightly different based on country context.
- <sup>m</sup> Includes <5% of deliveries by cadres of health workers other than doctors, nurses and midwives.
- <sup>n</sup> Data pertain to sexually active women of reproductive age.
- <sup>o</sup> Institutional births.
- <sup>p</sup> Includes deliveries by cadres of health workers other than doctors, nurses and midwives – range not available.
- <sup>q</sup> Includes >15% of deliveries by cadres of health workers other than doctors, nurses and midwives.

<sup>f</sup> Includes 5–15% of deliveries by cadres of health workers other than doctors, nurses and midwives.

<sup>s</sup> Data pertain to men and women of reproductive age.

<sup>t</sup> 5 or more visits.

<sup>u</sup> Estimate.

<sup>v</sup> Adjusted.

<sup>w</sup> 3 or more visits.

<sup>x</sup> Data pertain to nationals of the country.

<sup>y</sup> Excluding the Northern Province.

<sup>z</sup> Based on the Sudan Household Health Survey in Northern Sudan only.

<sup>aa</sup> 6 or more visits.

<sup>ab</sup> Excluding Northern Ireland.

<sup>ac</sup> Data pertain to men and women of reproductive age who are married or in union.

## Table 5 Risk factors

<sup>a</sup> WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation. Geneva, World Health Organization and UNICEF, 2010 ([www.wssinfo.org/en/welcome.html](http://www.wssinfo.org/en/welcome.html)).

<sup>b</sup> WHO household energy database. Geneva, World Health Organization, 2010 ([www.who.int/indoorair/database](http://www.who.int/indoorair/database)). These estimates use methods developed and implemented by the WHO/UNICEF Joint Monitoring Programme for Water Supply and Sanitation. Where solid fuel use information is available for two or more separate years (spaced at least five years apart) linear regression is performed. The linear regression line is extrapolated up to two years after the latest survey point and up to two years before the earliest survey point. Outside these time limits, the extrapolated regression line is flat for four years in either direction. Where coverage reaches 0% or 100%, a horizontal line is drawn from the year before coverage reaches 0% or 100%. For countries with solid fuel use at less than <5%, 0% is assumed for the calculation of regional or global aggregates; for countries with >95%, 95% is assumed in the calculation of the aggregate.

<sup>c</sup> UNICEF global database on low birthweight. New York, UNICEF, 2009 ([www.childinfo.org/lbw\\_birthweight\\_table.php](http://www.childinfo.org/lbw_birthweight_table.php) – November 2009 update).

<sup>d</sup> WHO global data bank on infant and young child feeding. Geneva, World Health Organization, 2009 ([www.who.int/nutrition/databases/infantfeeding/en/index.html](http://www.who.int/nutrition/databases/infantfeeding/en/index.html)).

<sup>e</sup> Global database on child growth and malnutrition. Geneva, World Health Organization, 2009 ([www.who.int/nutgrowthdb/database/en](http://www.who.int/nutgrowthdb/database/en)). Prevalence estimates are based on WHO standards.

<sup>f</sup> Comparisons between countries may be limited owing to differences in sample characteristics or survey years. Source: Global database on body mass index (BMI). Geneva, World Health Organization, 2010 ([www.who.int/bmi](http://www.who.int/bmi)).

<sup>g</sup> Global information system on alcohol and health. Geneva, World Health Organization, 2010 ([www.who.int/globalatlas/DataQuery/default.asp](http://www.who.int/globalatlas/DataQuery/default.asp)).

<sup>h</sup> Based on WHO report on the global tobacco epidemic, 2009: Implementing smoke-free environments. Geneva, World Health Organization, 2009. See Appendix VII, Age-standardized prevalence estimates for WHO Member States, 2006. Definition: smoking at the time of the survey of any form of tobacco, including cigarettes, cigars, pipes, bidis, etc. and excluding smokeless tobacco. These figures represent age-standardized prevalence rates for smoking tobacco and should only be used to draw comparisons of prevalence between countries and between men and women within a country. They should not be used to calculate the number of smokers in a country, region, income group or globally.

<sup>i</sup> WHO/CDC global youth tobacco survey (GYTS). Geneva, World Health Organization, 2010 ([www.cdc.gov/tobacco/global/GYTS/results.htm](http://www.cdc.gov/tobacco/global/GYTS/results.htm)). Data relate to tobacco use in any form in the past 30 days.

<sup>j</sup> Percentage of women and men aged 15–49 years who had more than one sexual partner in the past 12 months reporting the use of a condom during their last sexual intercourse. Data is from Demographic and Health Surveys (DHS) and excludes country-reported data. 2008 report on the global AIDS epidemic. Geneva, Joint United Nations Programme on HIV/AIDS, World Health Organization, 2008. See Annex 2: Country Progress Indicators.

# Footnotes

62+2>六九零  
81.4CL-3  
Y2K.2004  
18.5±4.5  
2004-2005  
Y2K

<sup>k</sup> Percentage of young men and women (aged 15–24 years) who both correctly identified ways of preventing the sexual transmission of HIV and who reject major misconceptions about HIV transmission. The data are derived from Demographic and Health Surveys (DHS) and Multiple Indicator Cluster Surveys (MICS) and exclude country-reported data. *2008 report on the global AIDS epidemic*. Geneva, Joint United Nations Programme on HIV/AIDS, World Health Organization, 2008. See Annex 2: Country Progress Indicators.

<sup>l</sup> Solid fuel use information is available for a single year; thus a horizontal line is drawn six years into the past and six years into the future.

<sup>m</sup> City surveys were extrapolated into country figures reported here.

<sup>n</sup> For those upper-middle or high-income countries with a GDP of more than US\$ 10 500 per capita in any given year, solid fuel use is assumed to be less than 5% (Rehfuss, Mehta & Prüss-Üstün 2006).

<sup>o</sup> Estimate includes significant tourist consumption.

<sup>p</sup> Lower limit is greater than 15.

<sup>q</sup> Upper limit is 49.

<sup>r</sup> Upper limit is greater than or equal to 65.

<sup>s</sup> Self-reported data.

<sup>t</sup> Solid fuel use information is available for two or more separate years spaced four or fewer years apart; thus an average is calculated. This average is extrapolated six years into the past and six years into the future.

<sup>u</sup> Data not approved by national authorities.

<sup>v</sup> Upper limit is between 54 and 65.

<sup>w</sup> A horizontal line at 95% coverage or above, or at 5% coverage or below, can be extrapolated without limitations up to the years 1990 and 2015 respectively.

<sup>x</sup> Upper limit is 44.

**Table 6 Health workforce, infrastructure and essential medicines**

<sup>a</sup> Source: *WHO global atlas of the health workforce*. Geneva, World Health Organization, 2009 ([www.who.int/globalatlas/autologin/hrh\\_login.asp](http://www.who.int/globalatlas/autologin/hrh_login.asp)). Please see this source for the latest updates, time-trend statistics and disaggregated data, as well as metadata descriptors. In general, the denominator data for health workforce density (i.e. national population estimates) were obtained from the *World population prospects* database of the United Nations Population Division (see Table 9 footnotes below). In some cases, official reports provided only workforce density indicators, from which estimates of the absolute numbers were calculated. Depending on the organization of national health systems and means of monitoring, data may not be exactly comparable across countries. Data from the years prior to 2000 were excluded from this edition.

<sup>b</sup> Sources: *PAHO basic indicators 2009*. Washington, DC, Pan American Health Organization, 2009 ([www.paho.org/English/SHA/coredata/tabulator/newTabulator.htm](http://www.paho.org/English/SHA/coredata/tabulator/newTabulator.htm)); *European health for all database* (HFA-DB). Copenhagen, WHO Regional Office for Europe, 2009 (<http://data.euro.who.int/hfadb>). *Country health information profiles* (CHIPS). Manila, WHO Regional Office for the Western Pacific, 2009 ([www.wpro.who.int/countries/countries.htm](http://www.wpro.who.int/countries/countries.htm)). *Core health indicators and MDGs*. New Delhi, WHO Regional Office for South-East Asia, 2008 (<http://203.90.70.117/esidas/CoreHealthData.asp>). Additional data compiled by the WHO Regional Office for Africa and WHO Regional Office for the Eastern Mediterranean.

<sup>c</sup> Source: *Surveys of medicine prices and availability using WHO/HAI standard methodology conducted between 2001 and 2008* ([www.haiweb.org/medicineprices/](http://www.haiweb.org/medicineprices/)). In individual surveys, availability is reported as the percentage of medicine outlets in which a medicine was found on the day of data collection. As baskets of medicines differ by individual country, results are not exactly comparable across countries. Median availability is determined for the specific list of medicines in each survey, and does not account for alternate dosage forms or strengths of these products or therapeutic alternatives. Public-sector data may be limited by the fact that the list of survey medicines may not correspond to national essential medicines lists (EMLs) where these exist, and some public-sector facilities may not be expected to stock all of the survey medicines. This has been addressed in the revised edition of the survey tool, which allows public-sector data to be analysed by EML status and level of care.

<sup>d</sup> Consumer price ratio = ratio of median local unit price to the Management Sciences for Health (MSH) international reference price of selected generic medicines. Source: *Surveys of medicine prices and availability using WHO/HAI standard*

*methodology conducted between 2001 and 2008* ([www.haiweb.org/medicineprices/](http://www.haiweb.org/medicineprices/)). Data are unadjusted for differences in the MSH reference price year used, exchange rate fluctuations, national inflation rates, variations in purchasing power parities, levels of development or other factors. In each survey, median consumer price ratios are obtained for the basket of medicines surveyed and found in at least four medicine outlets. As baskets of medicines differ by individual country, results are not exactly comparable across countries. However, data on specific medicines is publicly available on the HAI web site above, and matched basket comparisons on a subset of medicines can be made.

<sup>e</sup> Hospital beds include inpatient and maternity beds, but not cots and delivery beds.

<sup>f</sup> Did not survey public-sector medicine outlets.

<sup>g</sup> Availability data were excluded as they were assessed using different methods to those used in the current WHO/HAI methodology.

<sup>h</sup> Refers to the public sector only.

<sup>i</sup> Simple average of two surveys of medicine prices and availability in Shandong and Shanghai provinces, China.

<sup>j</sup> Restricted to reimbursed medicines available through public-sector outlets.

<sup>k</sup> Medicines are provided free to patients in the public sector.

<sup>l</sup> Simple average of seven surveys of medicine prices and availability in India (Chennai, Haryana, Karnataka, Maharashtra (12 districts); Maharashtra (4 regions); Rajasthan; and West Bengal).

<sup>m</sup> Refers to tertiary public-hospital beds only.

<sup>n</sup> Based on a survey of medicine prices and availability in Gauteng province, South Africa.

<sup>o</sup> Simple average of four surveys of medicine prices and availability in Sudan (Gadarif; Khartoum; North Kordofan; and Northern states).

## Table 7 Health expenditure

<sup>a</sup> Source: WHO National Health Accounts (NHA) *Country health expenditure* database. Geneva, World Health Organization, February 2010 ([www.who.int/nha/country/](http://www.who.int/nha/country/)). The regional, income and global figures are calculated using Purchasing Power Parity (PPP) terms. When the number is smaller than 0.05% the percentage may appear as zero. For per capita expenditure indicators, this is represented as <1. In countries where the fiscal year begins in July, expenditure data have been allocated to the later calendar year (for example, 2008 data will cover the fiscal year 2007–08). Absolute values of expenditures are expressed in nominal terms (current prices). National currency unit per US\$ are calculated using the average exchange rates for the year. For 2008, the use of yearly average exchange rates (compared to year-end exchange rates) may not fully represent the impact of the global financial crisis. GDP = gross domestic product.

<sup>b</sup> In some cases the sum of general government and private expenditures on health may not add up to 100% because of rounding.

<sup>c</sup> A new PPP series resulting from the 2005 *International Comparison Project* (ICP) estimated by the World Bank has been used since *World health statistics 2008*. In countries where this is not available, PPPs are estimated by WHO.

<sup>d</sup> A new basis for these estimates was provided by new NHA reports, surveys, National Accounts series, accessed information and/or country consultations.

<sup>e</sup> Non-profit institutions (such as nongovernmental organizations) serving households are accounted for in “external assistance” and recorded under government expenditure.

<sup>f</sup> GDP includes both licit and illicit GDPs (for example, opium). Government expenditures include external assistance (external budget).

<sup>g</sup> Estimates should be viewed with caution as these are derived from scarce data.

<sup>h</sup> About 30% of the expenditure in residential facilities for care of the aged has a health purpose, but this is difficult to estimate routinely and so is not included under health at present. Such health-purpose expenditure was about US\$ 2.1 billion in 2005–06 or 0.2% of GDP. The data for 2007 correspond to the fiscal year 2007–08 starting on 01 July 2007. All 2008 entries are estimates made by WHO unless otherwise specified.

<sup>i</sup> Adjustments for currency change (from old to new manat) were made for the entire Azerbaijan series starting from *World health statistics 2008*.

# Footnotes

62+2>六九零  
81.4CL-3  
Y2K.2004  
18.55+45  
B±β18.55+45

- <sup>j</sup> Fiscal year starts in July and expenditure data have been allocated to the later calendar year (i.e. 2007 data cover the fiscal year 2006–07).
- <sup>k</sup> Funds previously included in social security were reclassified.
- <sup>l</sup> A recent census in the country has shown differences in population data. However, the per capita levels used here are estimated based on United Nations Population Division data.
- <sup>m</sup> Increases in government expenditure on health are due to investment in capital expenditures.
- <sup>n</sup> As a result of recent health-care reforms in Georgia, public compulsory insurance has since 2008 been implemented by private insurance companies. The voucher cost of this insurance is treated as general government health expenditure.
- <sup>o</sup> Government expenditures show fluctuations due to variations in capital investment. Private-sector fluctuations are due to the large share of nongovernmental organizations, which are linked to external funding.
- <sup>p</sup> Exchange rate changed in 2002 from multiple to a managed floating exchange rate. Inter-bank market rate used prior to 2002.
- <sup>q</sup> The estimates do not include expenditures for Northern Iraq.
- <sup>r</sup> The public expenditure on health includes contributions from the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA) made to refugees from West Bank and Gaza Strip residing in Jordanian territories.
- <sup>s</sup> Government expenditures in 2002 show a large increase due to capital investment.
- <sup>t</sup> Revision of the General Government Expenditure series can explain changes in public expenditure ratios.
- <sup>u</sup> After the declaration of independence on 03 June 2006, Serbia and Montenegro are now separate states. Health expenditures for the previous years have been estimated separately for each of the two countries.
- <sup>v</sup> The market exchange rate is used to estimate the per capita figures.
- <sup>w</sup> Total level of government expenditure on health increased due to the inclusion of local government expenditure, as well as a more-comprehensive estimation of regional expenditure on health.
- <sup>x</sup> The health expenditure data as well as the population data after 2000 do not include Transnistria. Data on GDP and private final consumption expenditure exclude Transnistria from 1995.
- <sup>y</sup> The estimates do not include the expenditures of the provinces of Kosovo and Metohia, which are under the administration of the United Nations.
- <sup>z</sup> The exchange rate used for the Syrian Arab Republic is the rate for non-commercial transactions from the Central Bank of Syria.
- <sup>aa</sup> GDP does not include the income from petroleum.
- <sup>ab</sup> The country became independent in 2002. However, NHA estimates have been produced for previous years based on the available macro data.
- <sup>ac</sup> Until 2007 the fiscal year ended in June. There was then a transition period in the second quarter of 2007 to make the fiscal year equal to the calendar year. Expenditure data have been allocated exceptionally to the previous calendar year (i.e. 2005 data cover the fiscal year 2005–06).
- <sup>ad</sup> On 01 January 2009 Turkmenistan introduced the new manat ISO code TMT. The exchange rate between the old and the new currency is 1 TMT = 5000 TMM. The entire health expenditure series has been adjusted.

**Table 8 Health inequities**

- <sup>a</sup> Sources: Unless otherwise stated, data are derived from Demographic and Health Surveys (DHS) conducted since 2000. The DHS figures were extracted using STATcompiler software ([www.measuredhs.com/](http://www.measuredhs.com/) – accessed 08 January 2010). When not available using STATcompiler software, figures were extracted directly from DHS reports. For some countries and some of the indicators there were differences in the figures extracted from the country reports and STATcompiler. In these cases, following discussions with staff from the MEASURE DHS implementation group (ICF Macro), data from the country reports were used. Further information regarding the source of individual country data can be obtained on request from WHO. Figures in the “difference” columns may be affected by rounding.

- <sup>b</sup> Data derived from DHS relate to births occurring in the five years preceding the survey, unless otherwise stated. Data derived from MICS relate to births occurring in the two years preceding the survey.
- <sup>c</sup> The data refer to coverage of measles or MMR (measles, mumps, rubella) vaccine at 12, 15, 18, 24 or 30 months depending on the country.
- <sup>d</sup> For all countries where the source is DHS, the under-five mortality rate relates to the decade preceding the survey, except for Turkey where it relates to the five-year period preceding the survey.
- <sup>e</sup> Lowest educational level achieved by mother is “no education”; highest level is “secondary or higher”.
- <sup>f</sup> Data are derived from MICS (round 3). All MICS figures were extracted from country reports available on the UNICEF web site ([www.childinfo.org/](http://www.childinfo.org/) – accessed 13 February 2009; updated 08 January 2010).
- <sup>g</sup> The figures in parentheses are based on small numbers of cases (25–49 unweighted cases).
- <sup>h</sup> The figures were extracted directly from DHS reports as they were not available through STATcompiler software ([www.measuredhs.com/](http://www.measuredhs.com/) – accessed 08 January 2010).
- <sup>i</sup> Data for “births attended by skilled health personnel” relate to births occurring in the three years preceding the survey.

- <sup>e</sup> *UNESCO Institute for Statistics data centre*. Montreal, UNESCO Institute for Statistics, 2007 (<http://stats.uis.unesco.org> – accessed 18 December 2009).
- <sup>f</sup> PPP int. \$ = Purchasing Power Parity at international dollar rate. *World development indicators database, 2009*. Washington, DC, World Bank, 2009 ([www.worldbank.org/data](http://www.worldbank.org/data)).
- <sup>g</sup> *World development indicators database, 2009*. Washington, DC, World Bank, 2009 ([www.worldbank.org/data](http://www.worldbank.org/data)). These figures reflect the World Bank default poverty line.
- <sup>h</sup> The standard definition includes the percentage of children less than 5 years of age who were registered at the moment of the survey. The numerator of this indicator includes children whose birth certificate was seen by the interviewer, or whose mother or carer says the birth has been registered. *The state of the world's children 2009: Maternal and newborn health*. New York, United Nations Children's Fund, 2009.
- <sup>i</sup> *International data base (IDB)*. Washington, DC, US Census Bureau, 2009 ([www.census.gov/ipc/www/idb](http://www.census.gov/ipc/www/idb) – accessed 12 January 2010).
- <sup>j</sup> The number of women by age were estimated by the United Nations Population Division and published in the *World population prospects revision 2006*.
- <sup>k</sup> Differs from the standard definition.
- <sup>l</sup> For statistical purposes, the data for China do not include Hong Kong and Macao Special Administrative Regions of China.
- <sup>m</sup> Data pertain to nationals of the country.
- <sup>n</sup> Data pertain to Saudi women only.

## WHO regions<sup>2</sup>

**WHO African Region:** Algeria, Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central African Republic, Chad, Comoros, Congo, Côte d'Ivoire, Democratic Republic of the Congo, Equatorial Guinea, Eritrea\*, Ethiopia, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, Rwanda, Sao Tome and Principe, Senegal, Seychelles, Sierra Leone, South Africa, Swaziland, Togo, Uganda, United Republic of Tanzania, Zambia, Zimbabwe.

**WHO Region of the Americas:** Antigua and Barbuda, Argentina, Bahamas, Barbados, Belize, Bolivia (Plurinational State of), Brazil, Canada, Chile, Colombia, Costa Rica, Cuba, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, United States of America, Uruguay, Venezuela (Bolivarian Republic of).

**WHO South-East Asia Region:** Bangladesh, Bhutan, Democratic People's Republic of Korea, India, Indonesia, Maldives, Myanmar, Nepal, Sri Lanka, Thailand, Timor-Leste\*.

**WHO European Region:** Albania, Andorra\*, Armenia\*, Austria, Azerbaijan\*, Belarus, Belgium, Bosnia and Herzegovina\*, Bulgaria, Croatia\*, Cyprus, Czech Republic\*, Denmark, Estonia\*, Finland, France, Georgia\*, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Kazakhstan\*, Kyrgyzstan\*, Latvia\*, Lithuania\*, Luxembourg, Malta, Monaco, Montenegro\*, Netherlands, Norway, Poland, Portugal, Republic of Moldova\*, Romania, Russian Federation, San Marino, Serbia\*, Slovakia\*, Slovenia\*, Spain, Sweden, Switzerland, Tajikistan\*, The former Yugoslav Republic of Macedonia\*, Turkey, Turkmenistan\*, Ukraine, United Kingdom, Uzbekistan\*.

**WHO Eastern Mediterranean Region:** Afghanistan, Bahrain, Djibouti, Egypt, Iran (Islamic Republic of), Iraq, Jordan, Kuwait, Lebanon, Libyan Arab Jamahiriya, Morocco, Oman, Pakistan, Qatar, Saudi Arabia, Somalia, Sudan, Syrian Arab Republic, Tunisia, United Arab Emirates, Yemen.

**WHO Western Pacific Region:** Australia, Brunei Darussalam, Cambodia, China, Cook Islands, Fiji, Japan, Kiribati, Lao People's Democratic Republic, Malaysia, Marshall Islands\*, Micronesia (Federated States of)\*, Mongolia, Nauru\*, New Zealand, Niue\*, Palau\*, Papua New Guinea, Philippines, Republic of Korea, Samoa, Singapore, Solomon Islands, Tonga, Tuvalu\*, Vanuatu, Viet Nam.

## Income groups<sup>3</sup>

**Low income:** Afghanistan, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Comoros, Democratic People's Republic of Korea, Democratic Republic of the Congo, Eritrea, Ethiopia, Gambia, Ghana, Guinea, Guinea-Bissau, Haiti, Kenya, Kyrgyzstan, Lao People's Democratic Republic, Liberia, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Rwanda, Senegal, Sierra Leone, Somalia, Tajikistan, Togo, Uganda, United Republic of Tanzania, Uzbekistan, Viet Nam, Yemen, Zambia, Zimbabwe.

**Lower middle income:** Albania, Angola, Armenia, Azerbaijan, Belize, Bhutan, Bolivia (Plurinational State of), Cameroon, Cape Verde, China, Congo, Côte d'Ivoire, Djibouti, Ecuador, Egypt, El Salvador, Georgia, Guatemala, Guyana, Honduras, India, Indonesia, Iran (Islamic Republic of), Iraq, Jordan, Kiribati, Lesotho, Maldives, Marshall Islands, Micronesia (Federated States of), Mongolia, Morocco, Nicaragua, Nigeria, Pakistan, Papua New Guinea, Paraguay, Philippines, Republic of Moldova, Samoa, Sao Tome and Principe, Solomon Islands, Sri Lanka, Sudan, Swaziland, Syrian Arab Republic, Thailand, Timor-Leste, Tonga, Tunisia, Turkmenistan, Tuvalu\*\*, Ukraine, Vanuatu.

<sup>2</sup> Member States indicated with an \* may have data for periods prior to their official membership of WHO.

<sup>3</sup> World Bank list of economies (July 2009). Washington, DC, World Bank, July 2009: <http://siteresources.worldbank.org/DATSTATISTICS/Resources/CLASS.XLS>  
Member States marked with an \*\* have been classified into income groups using gross domestic product.

**Upper middle income:** Algeria, Argentina, Belarus, Bosnia and Herzegovina, Botswana, Brazil, Bulgaria, Chile, Colombia, Cook Islands\*\*, Costa Rica, Cuba, Dominica, Dominican Republic, Fiji, Gabon, Grenada, Jamaica, Kazakhstan, Latvia, Lebanon, Libyan Arab Jamahiriya, Lithuania, Malaysia, Mauritius, Mexico, Montenegro, Namibia, Nauru\*\*, Niue\*\*, Palau, Panama, Peru, Poland, Romania, Russian Federation, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Serbia, Seychelles, South Africa, Suriname, The former Yugoslav Republic of Macedonia, Turkey, Uruguay, Venezuela (Bolivarian Republic of).
